Cruise Summary

>4000 km of Hi-Res Seismic Lines

62 Cores totaling >380 m of sediments

23 Jumbo Piston Cores

35 Gravity Cores

4 Multi-Cores

A sunset over the ocean with a bird in flight. The sun is low on the horizon, creating a bright orange and yellow glow. A single bird is silhouetted against the bright light of the sun. The sky is filled with soft, wispy clouds, and the water reflects the colors of the sunset.

Three Seismic Configurations

2 Liquid-filled streamers with 1 air gun – Recon mode

High-res seismic data quickly – 8 kt

Velocity analysis is difficult

Not enough penetration in older exposed material

Not enough penetration in older exposed material

2 new solid streamers (700 m) + 3 liquid-filled streamers (300 m) + 2 air guns

1 liquid-filled streamer failed early on (connection issue?)

2 new solid streamers + 2 liquid-filled streamers (total streamer = 900 m) + 2 air guns

Ship Velocity = 5 kts (4.8 kts)

Differences in Solid vs liquid

Receiving groups 6.25 m vs 12.5 m

Less noise (new electronics + solid vs liquid may influence travel thru H₂O)

Greater total length of streamers = potential for better velocity analysis

Still in progress

Compare 700 m @ 6.25 m vs 900 m @ 12.5 m

You may want one of us to present these results next year

Streamer Configuration – Greg Mountain's art

Please DO NOT ERASE

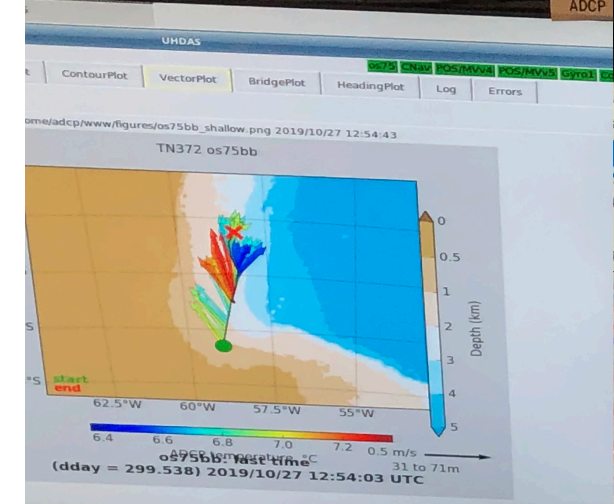

Recon mode vs Full streamer + 2 air guns

RadExPro Seismic processing software

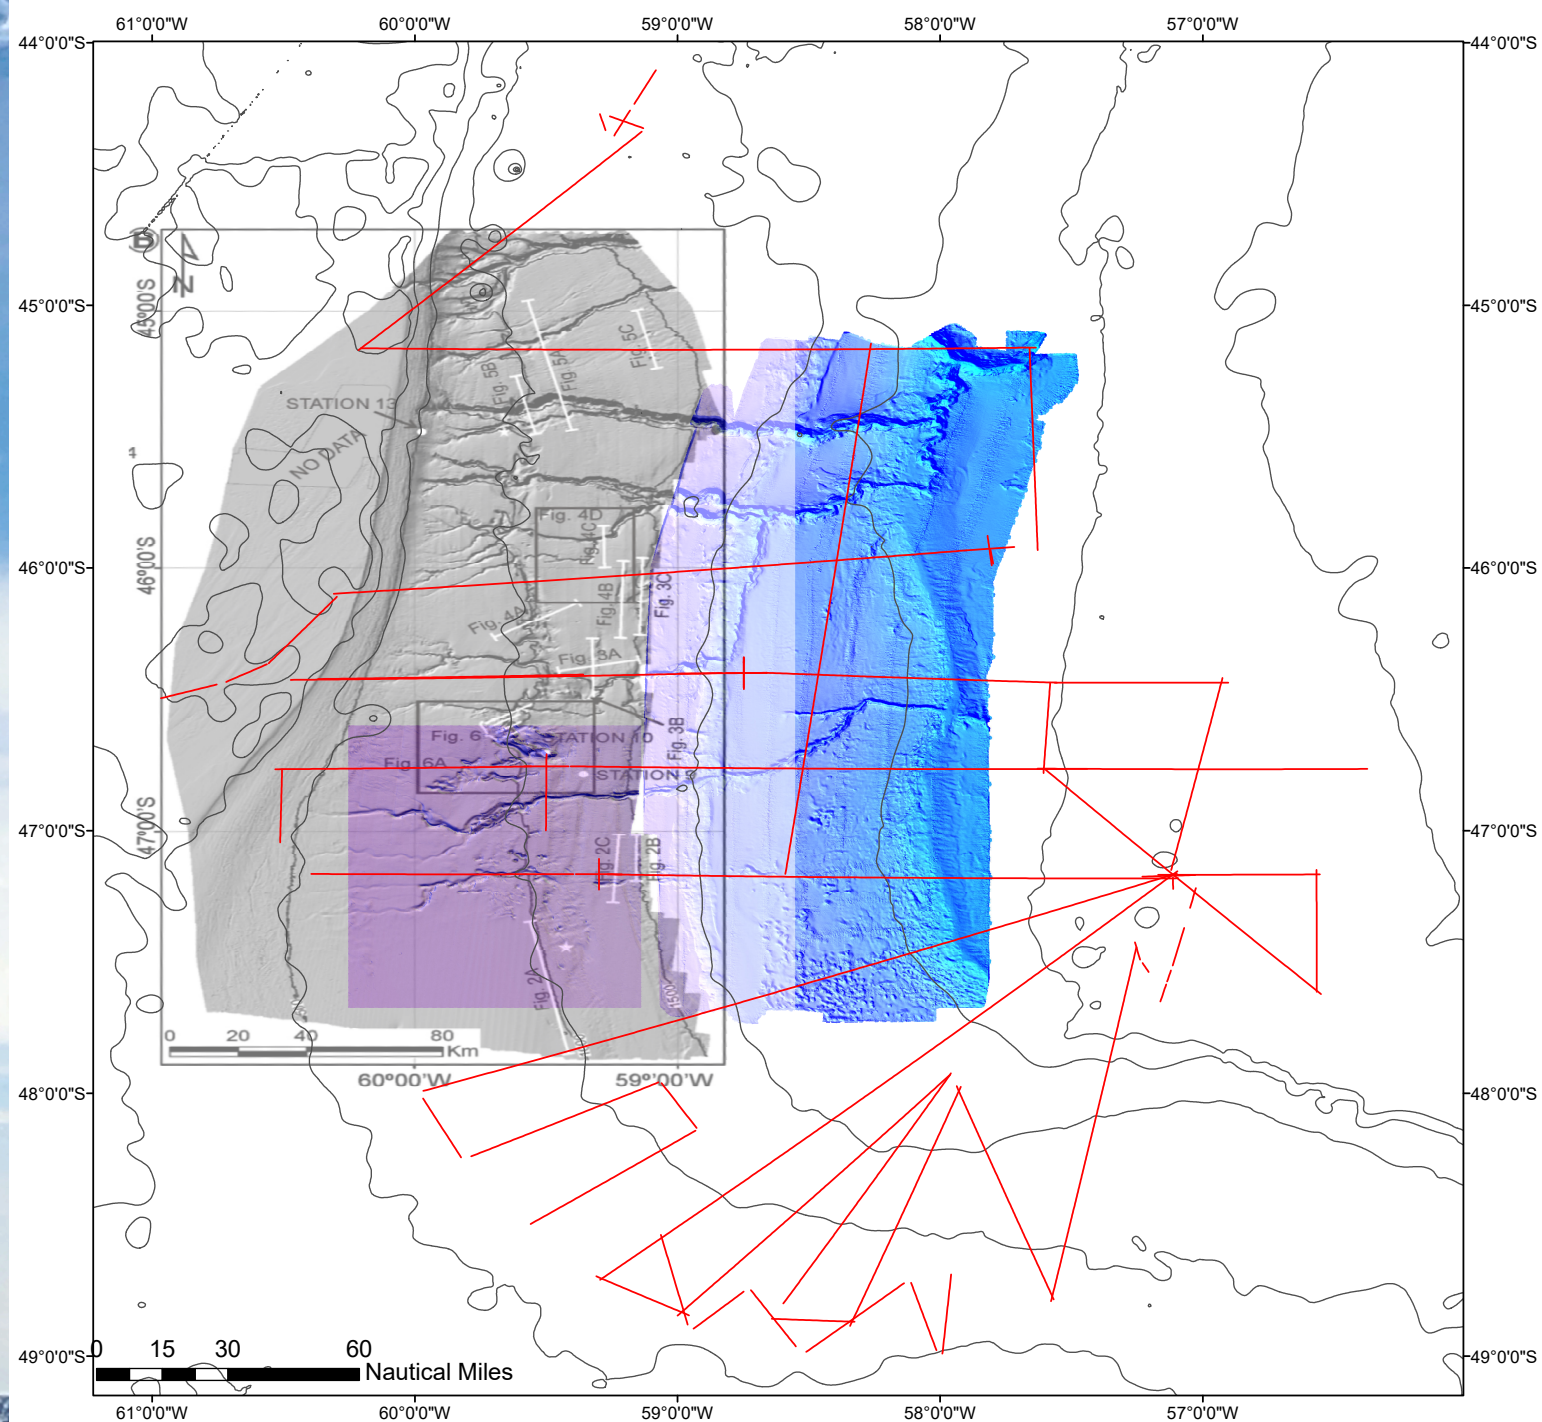

Seismic Processing

Processed in real time on the ship using Seismic Unix

Dell precision 7540. 64GB of RAM and 2TB (SSD) of storage. XEON processor

Some lines are up to 50 Gb
~ 6 hours on the ship

High Speed computing @ RU
~ 1 hour

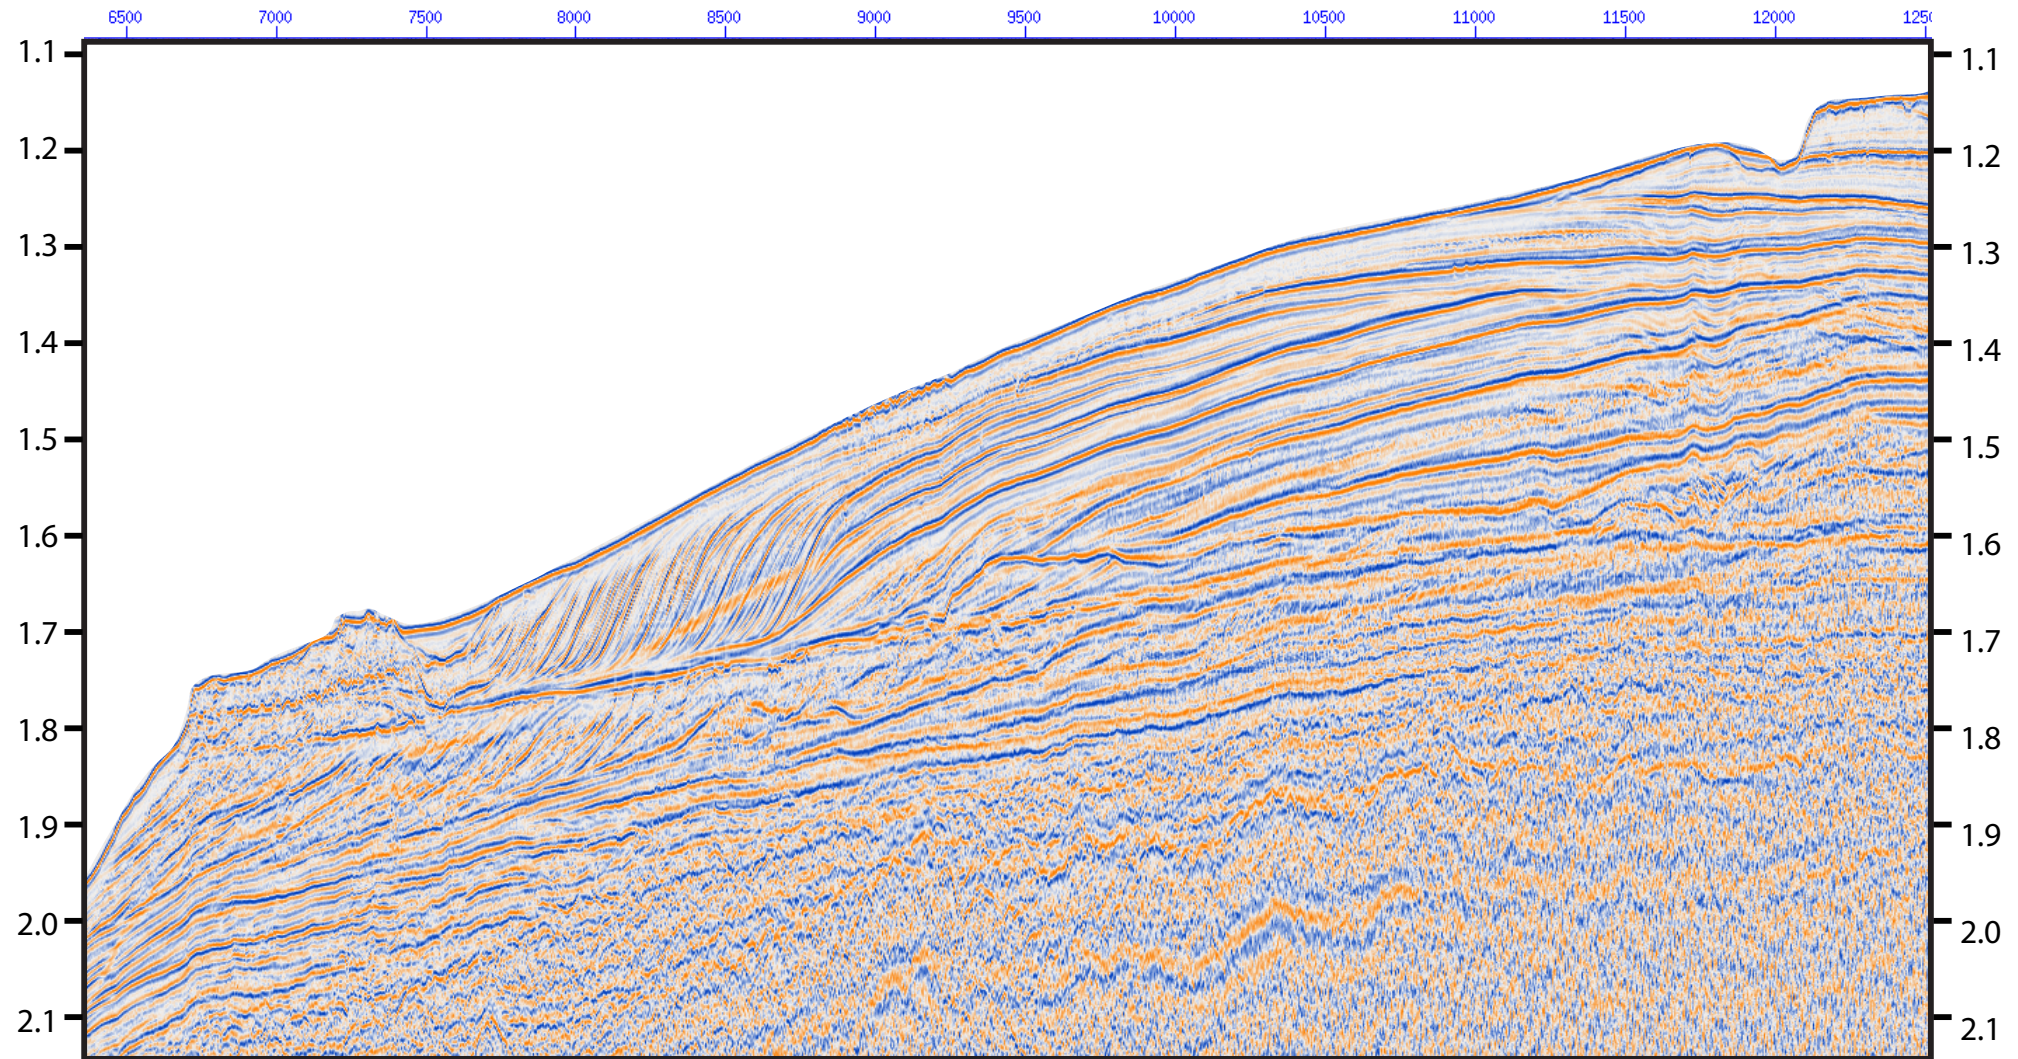

Off the Ship Results – Image 1.2 to 1.5 sec

Proper Processing should yield more

Off the Ship Results – Cretaceous to Eocene

Seismic Unix
(rookies)

A Little Bit of Science

Current sweep sediments on the upper margin
into canyons => carried downslope
Slope change at 2200 m and sediments overflow
S to N Current (UCDW) form drifts
