COMMENTS

All areas test free of 14C contamination. The ship, warehouse freezers and Van #7 were clean of tritium contamination. Tritium contamination was found in Van #1, at levels that require cleanup before any use. We suggest that Van #1 be decontaminated using the enclosed procedure because there are areas in Van #1 above 10,000 dpm/m2 and there appears to be widespread tritium throughout the van, including deck areas. The heaviest contamination is in the Consul 230 refrigerator/freezer, we recommend thorough cleaning of the Consul 230 refrigerator/freezer and disposal of the drawer/basket at the bottom.
