

Hydrodynamic Analysis and Design Methods for Energy Efficient Ships

David Kring April 8, 2014

Green Boats: Ship Design Tools

Green Ports: Alternative Energy

Overview

Green Boats:

- Analysis and Design Methods
- Hydrodynamic Research
- Case Study: Wind Farm Vessel

Green Ports:

- Plasma actuation for Wind Turbines

Developer and User Community

*Codes must be supported across a wide base to survive and thrive
... some shared source development, no-cost executable licenses*

Academic Partners:

Univ. of Rhode Island (Prof. Stephan Grilli, Prof. Jason Dahl ... Ocean Eng)
Univ. of Michigan (Prof. Julie Young, Prof. Kevin Maki, Prof. David Singer)
MIT (Prof. Stefano Brizollara)
George Mason Univ. (Prof. Chi Yang)
Stevens Institute (Prof. Raju Datla, Prof. Len Imas)
Webb Institute (Prof. Rick Royce, Prof. Adrian Onias)
with additional involvement from others, eg. US Naval Academy

Government:

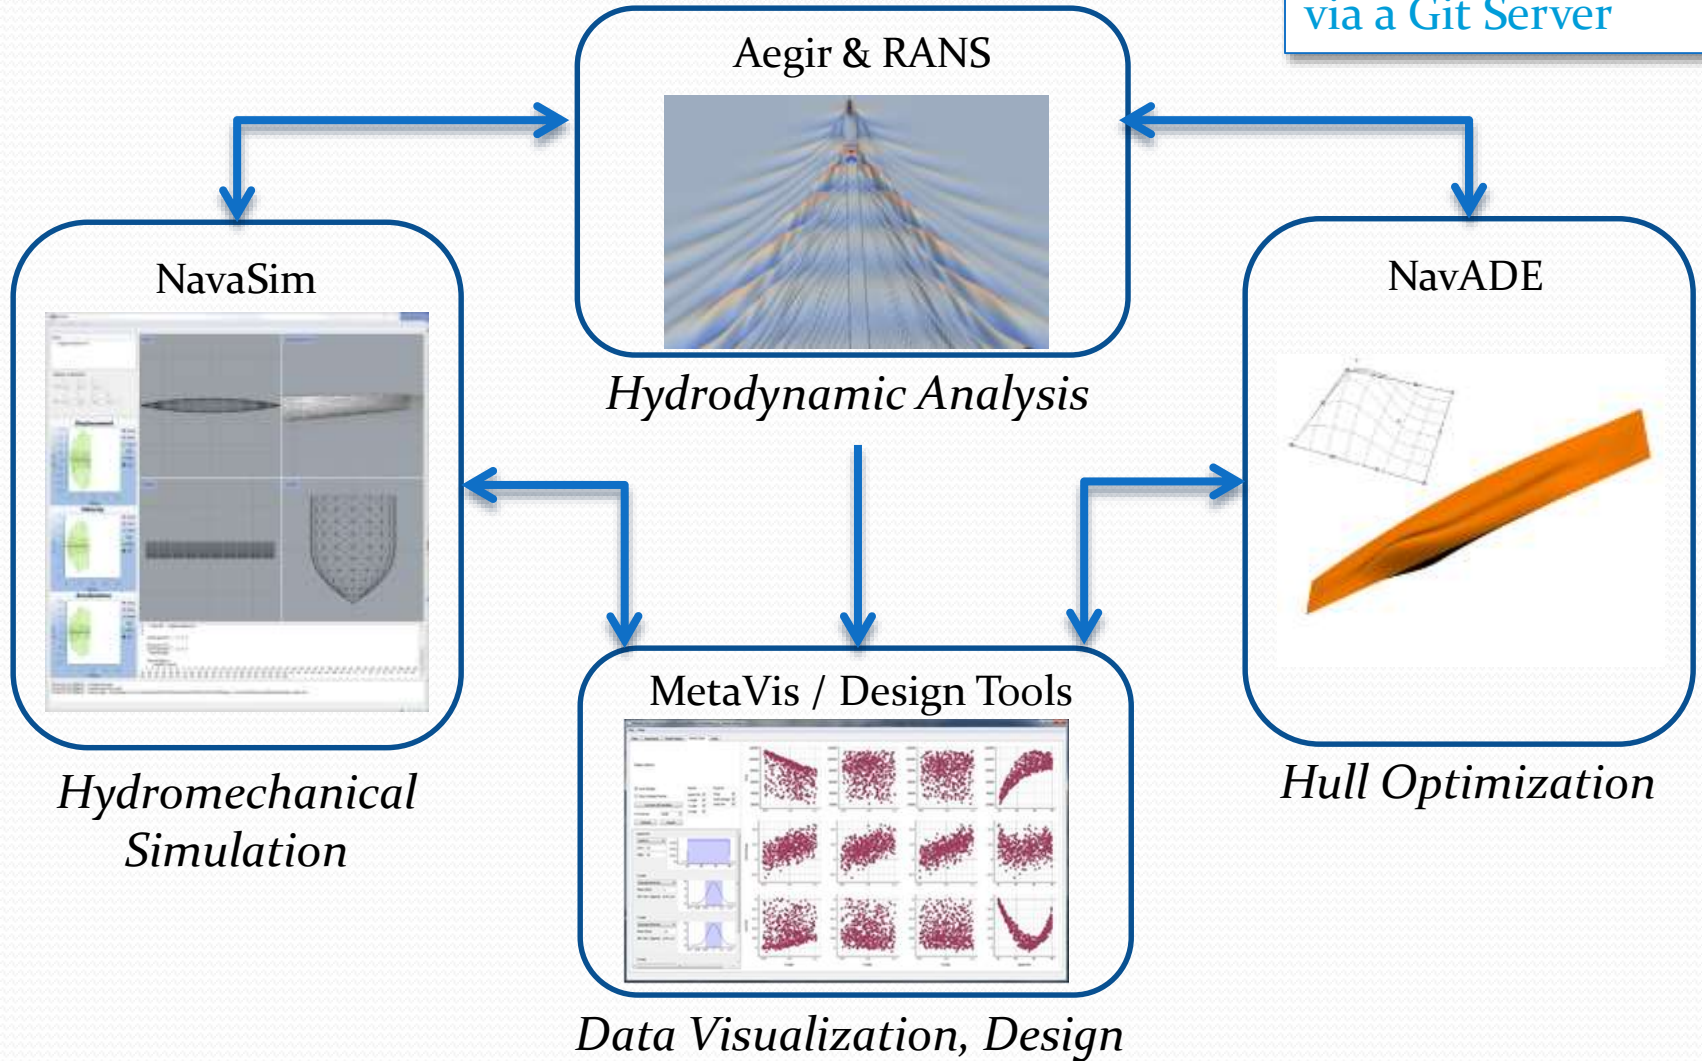

ONR, NAVSEA, NSWC-CD
US Marine Corps
Sandia National Labs, NREL

Industry: various companies

Foreign: French Naval Academy and DCNS, Denmark, Italy (INSEAN), Singapore, UK

Navatek Analysis and Design Tools

“Open” Source
shared development
via a Git Server

Design Methods: Escaping the Design Spiral

Set-based Design

flexibility in the design process

Network Theory

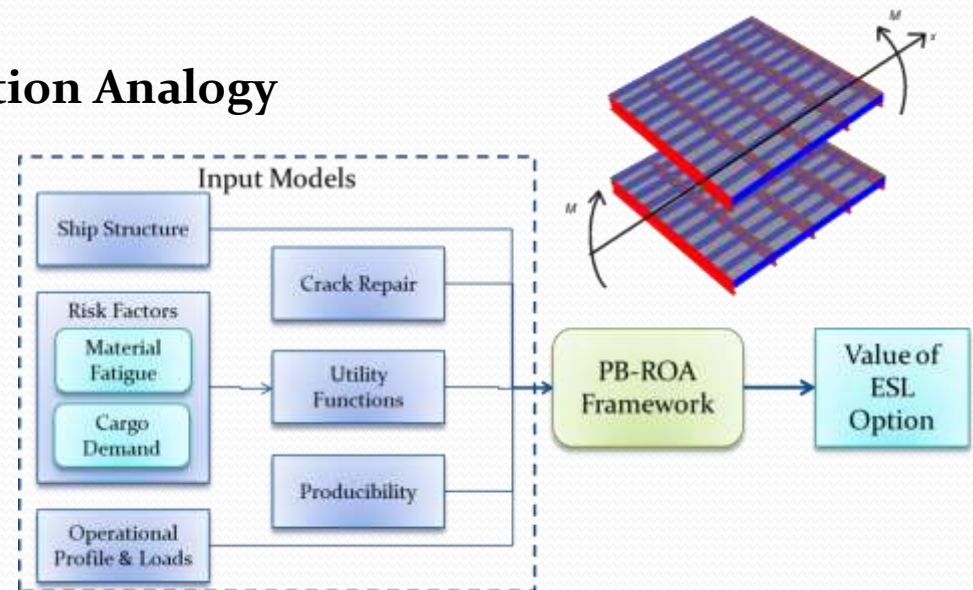

identifying important couplings

Markov Decision Process

ramifications of design decisions

Prospect-Theory Based Real Option Analogy

hedging the design

Multi-Fidelity Hydrodynamic Analysis

*Free-surface hydrodynamics (Waves)
... complex computational challenge
due to dispersion and nonlinearity*

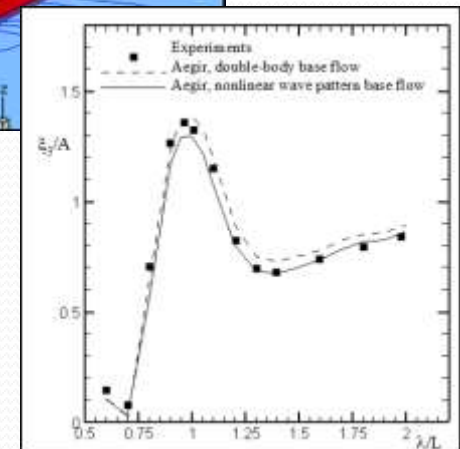

High-Fidelity (OpenFOAM, FINE/Marine)

- Few physical assumptions
- Very expensive computationally ... orders of magnitude slower than medium fidelity

Medium-Fidelity (Aegir)

- Sufficient assumptions to capture design trends
- Seakeeping simulation faster than real time

Low-Fidelity (Slender body theory, semi-empirical forms, ...)

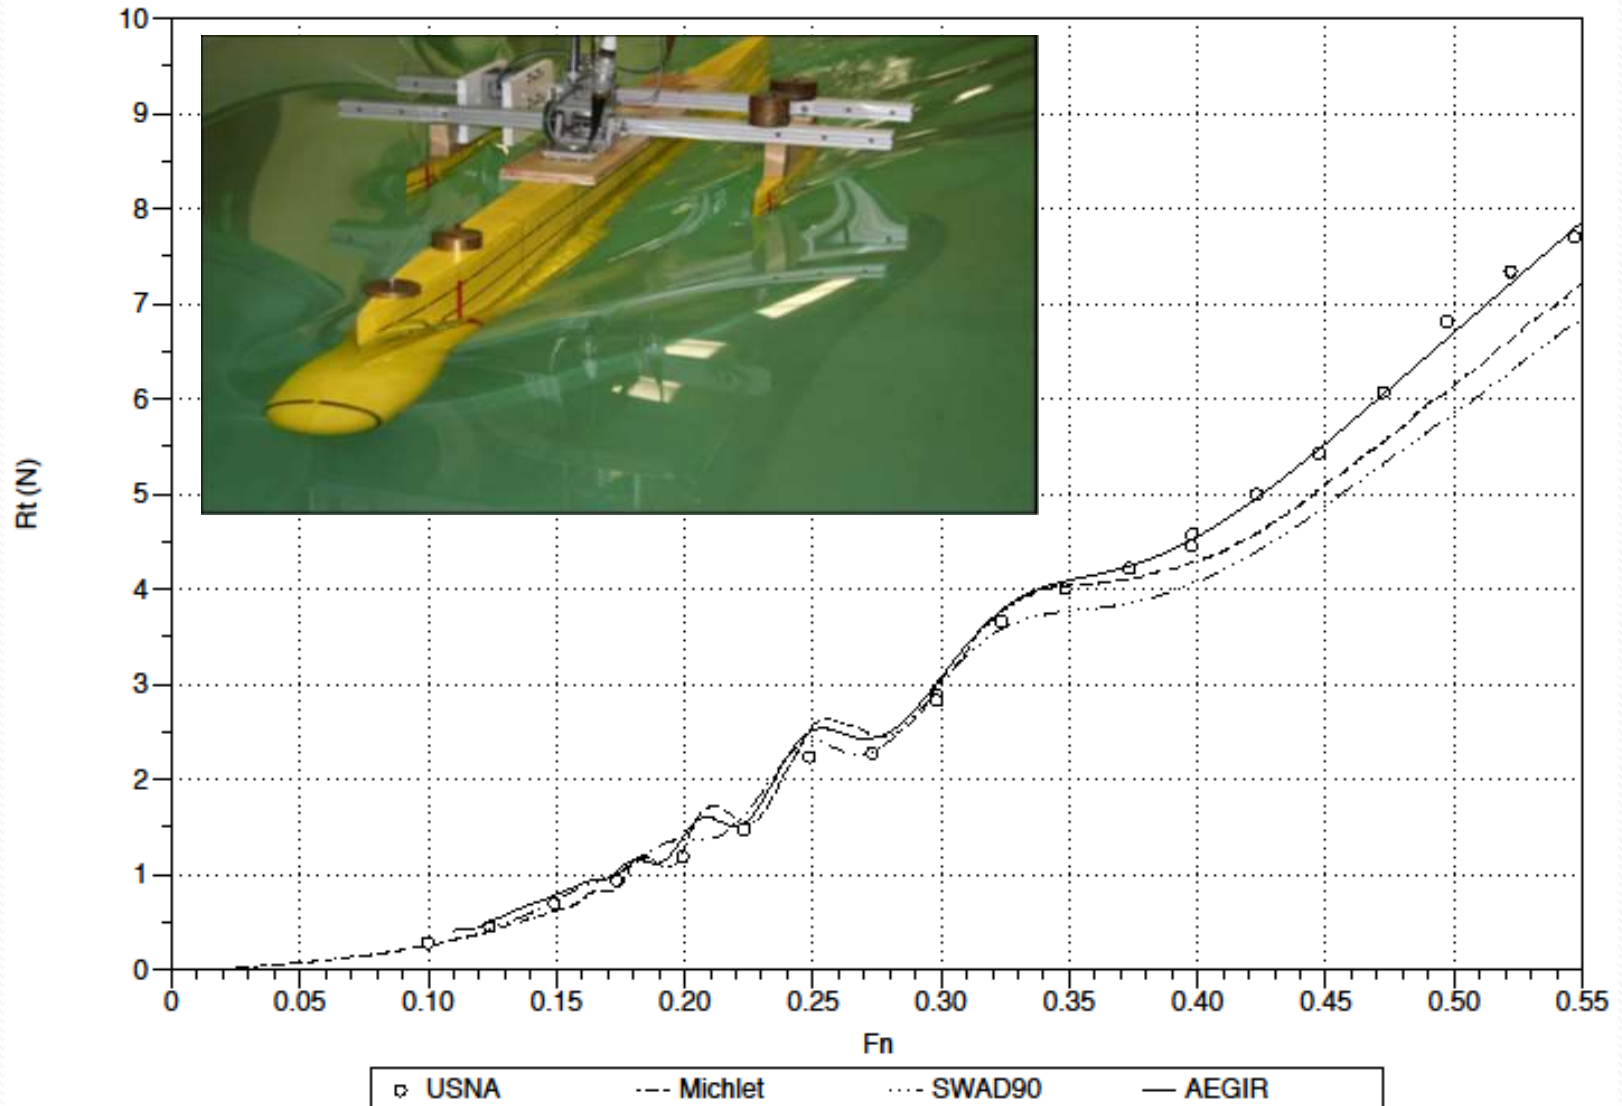

Aegir Capabilities

- Steady wave resistance
- Seakeeping and added resistance in waves
- Lift modeling for hydrofoils or propulsors
- Fluid-structure interaction ... weight can hurt energy efficiency
- Flexible application
 - Commercial or Naval Ships
 - Offshore Platforms
 - Control algorithms
 - Flight dynamics
 - Air Cushion Vehicles
 - Multi-body connections

Multi-hull Wave Resistance Validation

Hydrodynamics Research

Transom Stern Modeling

Verification and Validation

Nonlinear Free Surface

Efficient Hybrid Methods

3D High-Speed Simulations

Impulse Response Functions

Wave Loads & Structures

STEM Ship Design Competition

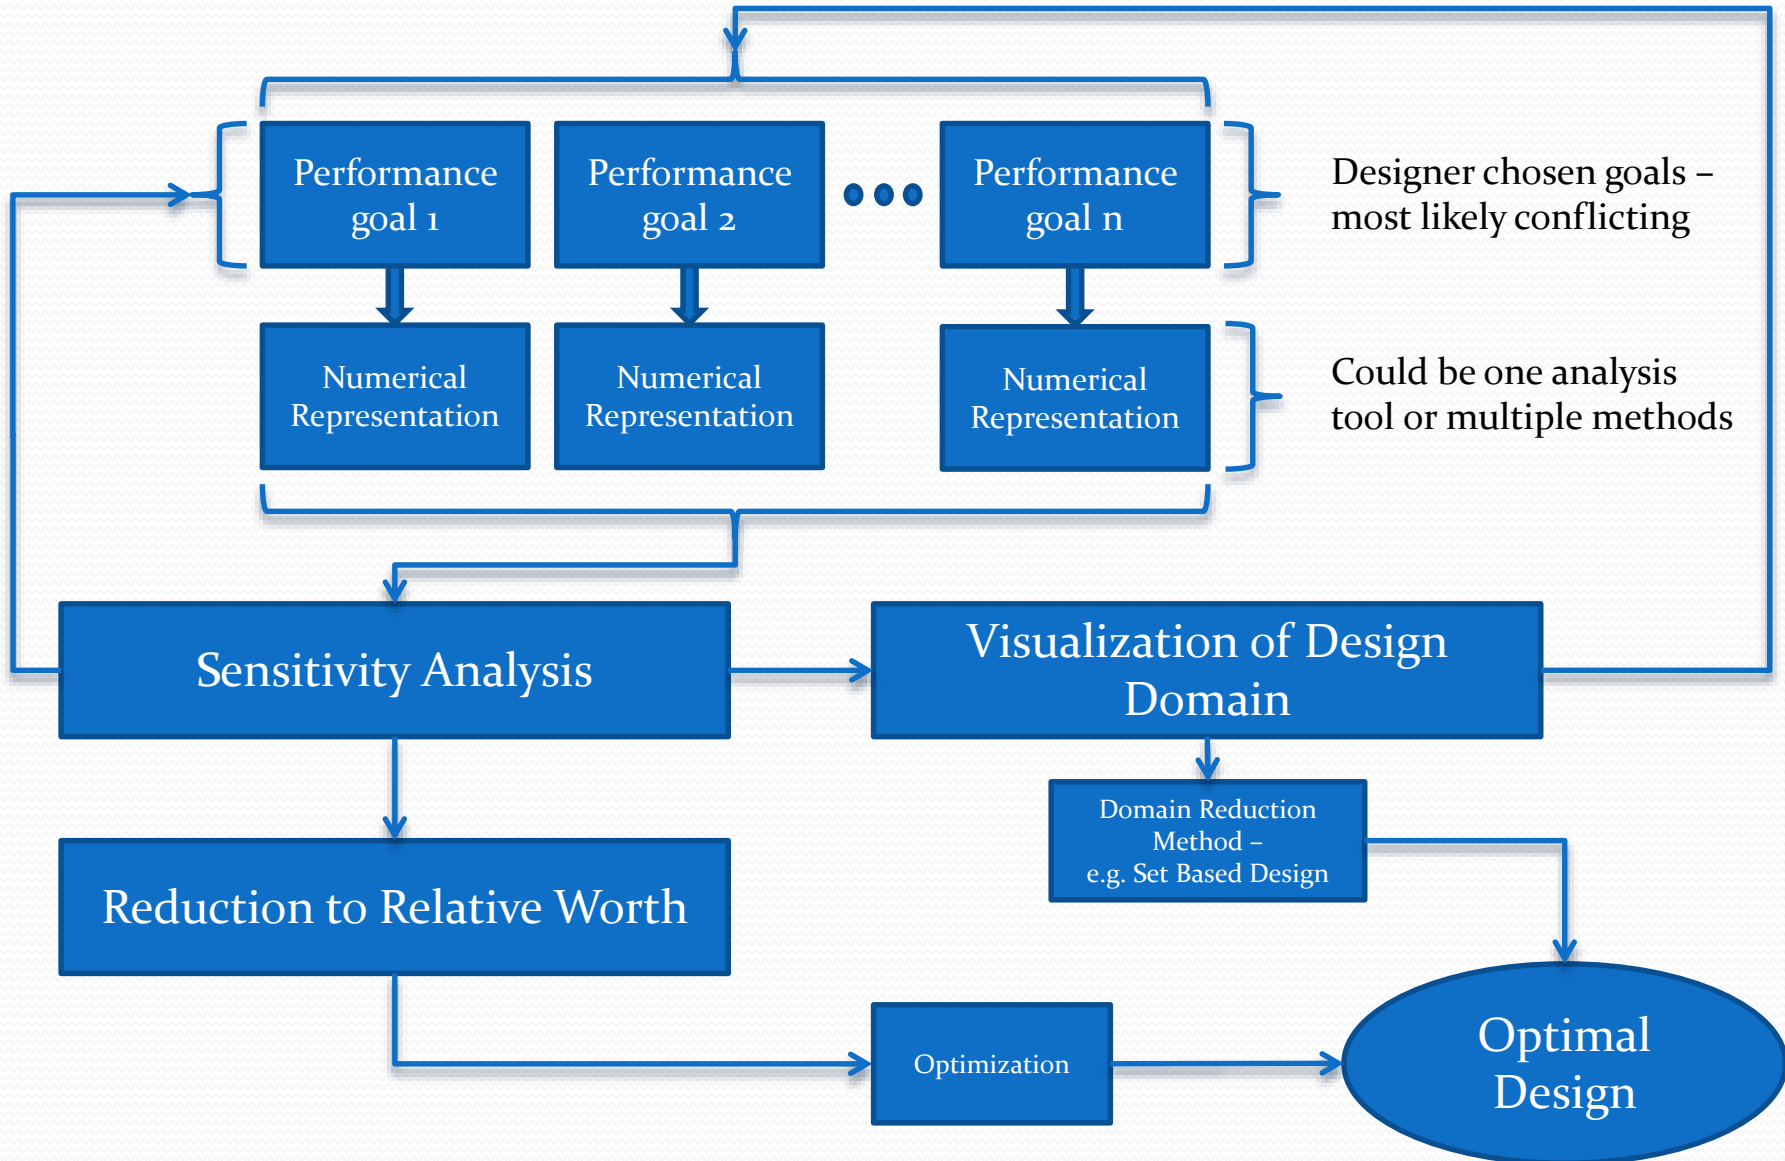

Hybrid Viscous Methods

- Flow decomposition through a perturbation approach, combining potential flow solution (Aegir) with viscous terms
- Lattice Boltzmann Method (URI)
 - Particle distribution functions with a position and momentum propagate over a defined lattice
 - Highly suited to efficient implementation on GPGPU's

Collaboration with URI (Jason Dahl, Stephan Grilli)

Wind Farm Service Vessel

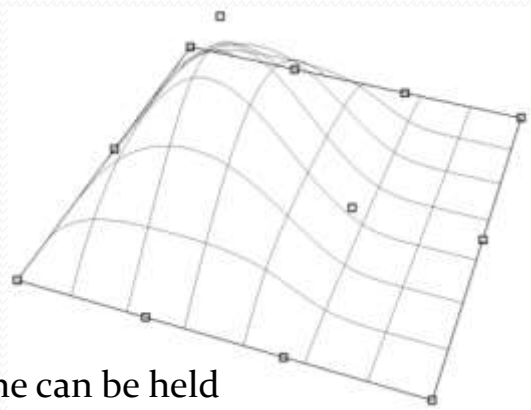

Shape Manipulation – Hull

Corners of isocurves represent locations of radial basis functions

Radial basis functions applied to a spline allow for large variations in geometry

Regions of spline can be held constant by holding some basis functions fixed

Result is a continuous spline with guaranteed 2nd order fairness with large amount of control

Shape Manipulation – Lifting Bodies

- Radial basis functions not well suited for lifting surfaces in non-viscous solution – amount of freedom too great
- Direct manipulation of gross dimensions used – span, chord, camber, thickness, angle, & position

Evaluation of Candidate Designs

Aegir Steady Solution

- Wave Making Resistance
- Total Lift
- Dynamic Lift
- Total Moment

- Wetted Area
- Sinkage
- Trim

Separation likelihood

Stratford Criterion

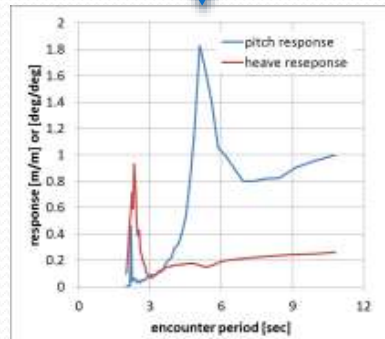

$$C_P \sqrt{x \frac{dC_p}{dx}} = \left(\frac{Re}{10^6} \right)^{0.1} S$$

$$S = \begin{cases} 0.35 \frac{d^2y}{dx^2} > 0 \\ 0.39 \frac{d^2y}{dx^2} < 0 \end{cases}$$

Flat Spectrum Solution

Motions in flat spectrum can be used to estimate response in various conditions

Cavitation? – pressure < P_{cav}

Frictional resistance – ITTC '78

Aegir Unsteady Solution

Other Checks

Determination of Relative Worth

Objective Function

Heave motions at CG Pitch motions at CG

$$C = \left(\frac{L}{D} - \sum_{U=0,17} \xi_3 + \xi_5 \right) * CAV * SEP$$

$$CAV = \begin{cases} 1 & \text{Hull is not cavitating} \\ 0 & \text{Hull is cavitating} \end{cases}$$

$$SEP = \begin{cases} 1 & \text{Hull is not separating} \\ 0 & \text{Hull is separating} \end{cases}$$

Particle Swarm Optimization

$$v_i[t + 1] = wv_i[t] + C_l(l_i - x_i[t]) + C_g(g[t] - x_i[t])$$

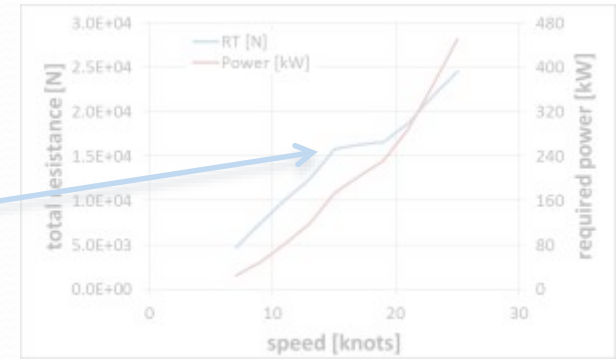

$$x_i[t + 1] = x_i[t] + v_i[t + 1]$$

Optimal Design

Motions were optimized to avoid incident wave spectrum peak – could perform poorly outside of this spectrum

Total resistance shows that the single-speed steady resistance check was somewhat exploited

o Speed

17 knots

LOA: 19.9 m
 LWL: 18.3 m
 BOA: 8.5 m
 BWL: 1.0 m (per side)
 Δ : 45 MT
 AWP: 21.0 m²
 $2V^{2/3} = 23.8$

Optimal Design

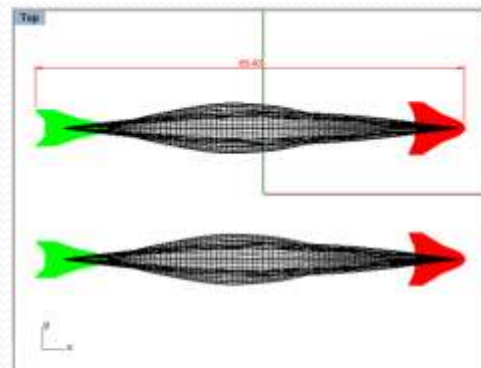

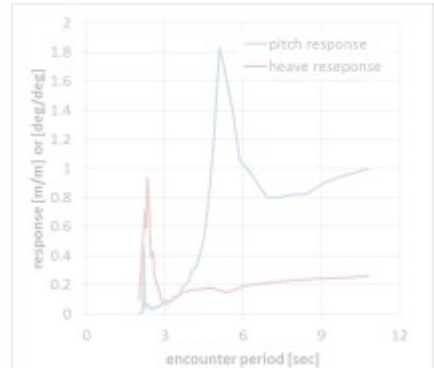

Motions were optimized to avoid incident wave spectrum peak – could perform poorly outside of this spectrum

Total resistance plot indicates that checking resistance at only 17 knots was exploited by optimization routine

o Speed

17 knots

LOA: 19.9 m
 LWL: 18.3 m
 BOA: 8.5 m
 BWL: 1.0 m (per side)
 Δ : 45 MT
 AWP: 21.0 m²
 $2\bar{V}^{2/3} = 23.8$
