Overview of air-sea interaction and surface processes

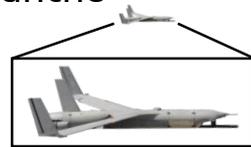

- Coupling of atmospheric and oceanic boundary layers plays an important role in local and global fluxes of mass, momentum, and energy
- Transfers actively modulated by the surface wave field
- **Wind forcing** injects energy into the wave field
 - Mixes surface waters
 - Directly influences turbulent heat transfer
- **Wave breaking:**
 - Energy transferred to currents and turbulence
 - Also important for **gas transfer** and **aerosol generation**
- Air-sea fluxes are not well understood, especially in **high wind and wave** environments (e.g., high latitudes, extreme conditions)

NSF/NCAR C130
(2004 GOTEX)

Piper Twin Comanche
(2007 –)

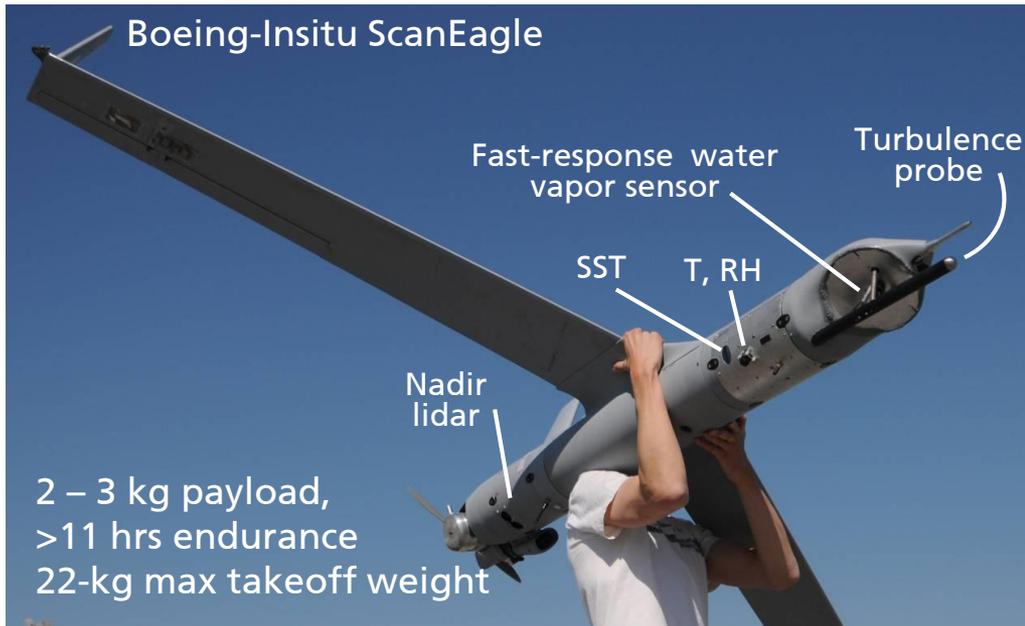

ScanEagle
(2012 –)

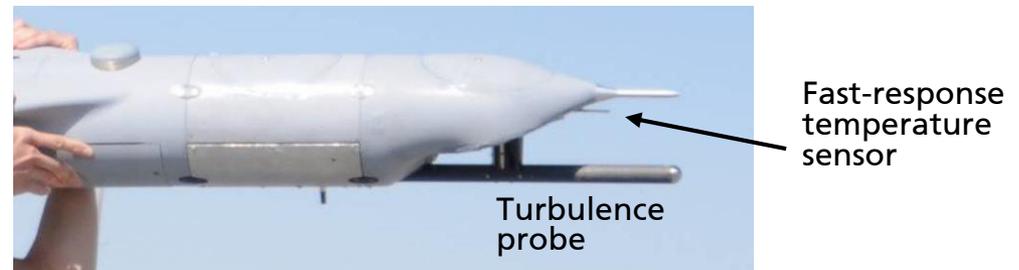

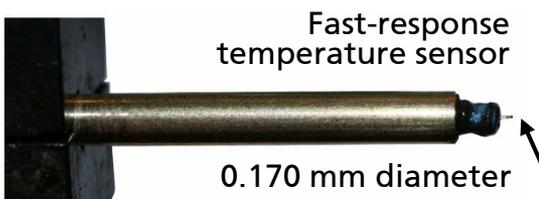

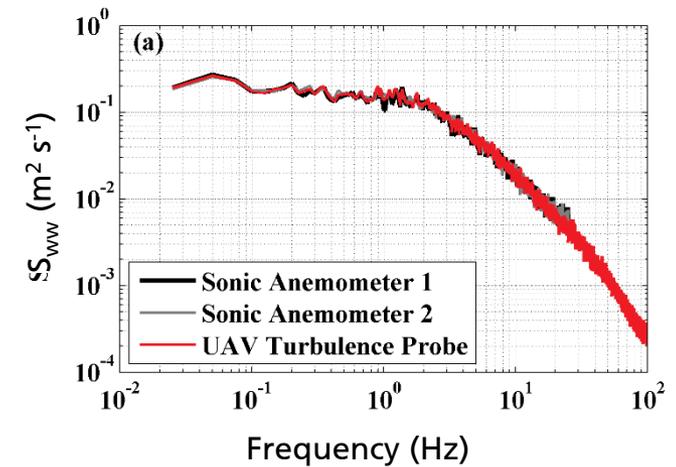

- Aircraft provide an **efficient** way to measure meter to mesoscale processes over **large spatial** ranges
- To measure surface fluxes, need to be close to the surface ($\leq 30 \text{ m}$)
- Transition to **smaller, lighter, safer** platforms
- Unmanned Aerial Vehicles: safety, endurance, ship-launched (remote locations)

"Flux" payload: wind, momentum and scalar flux measurements

- Fast-response turbulence probe (3D wind) + temperature, water vapor sensors
- Calibration: wind tunnel + in-flight maneuvers (Reineman et al. 2013)
- Main purpose: measure momentum and scalar heat fluxes
- Also includes: point lidar, GPS/Inertial Measurement Unit (IMU), data acquisition

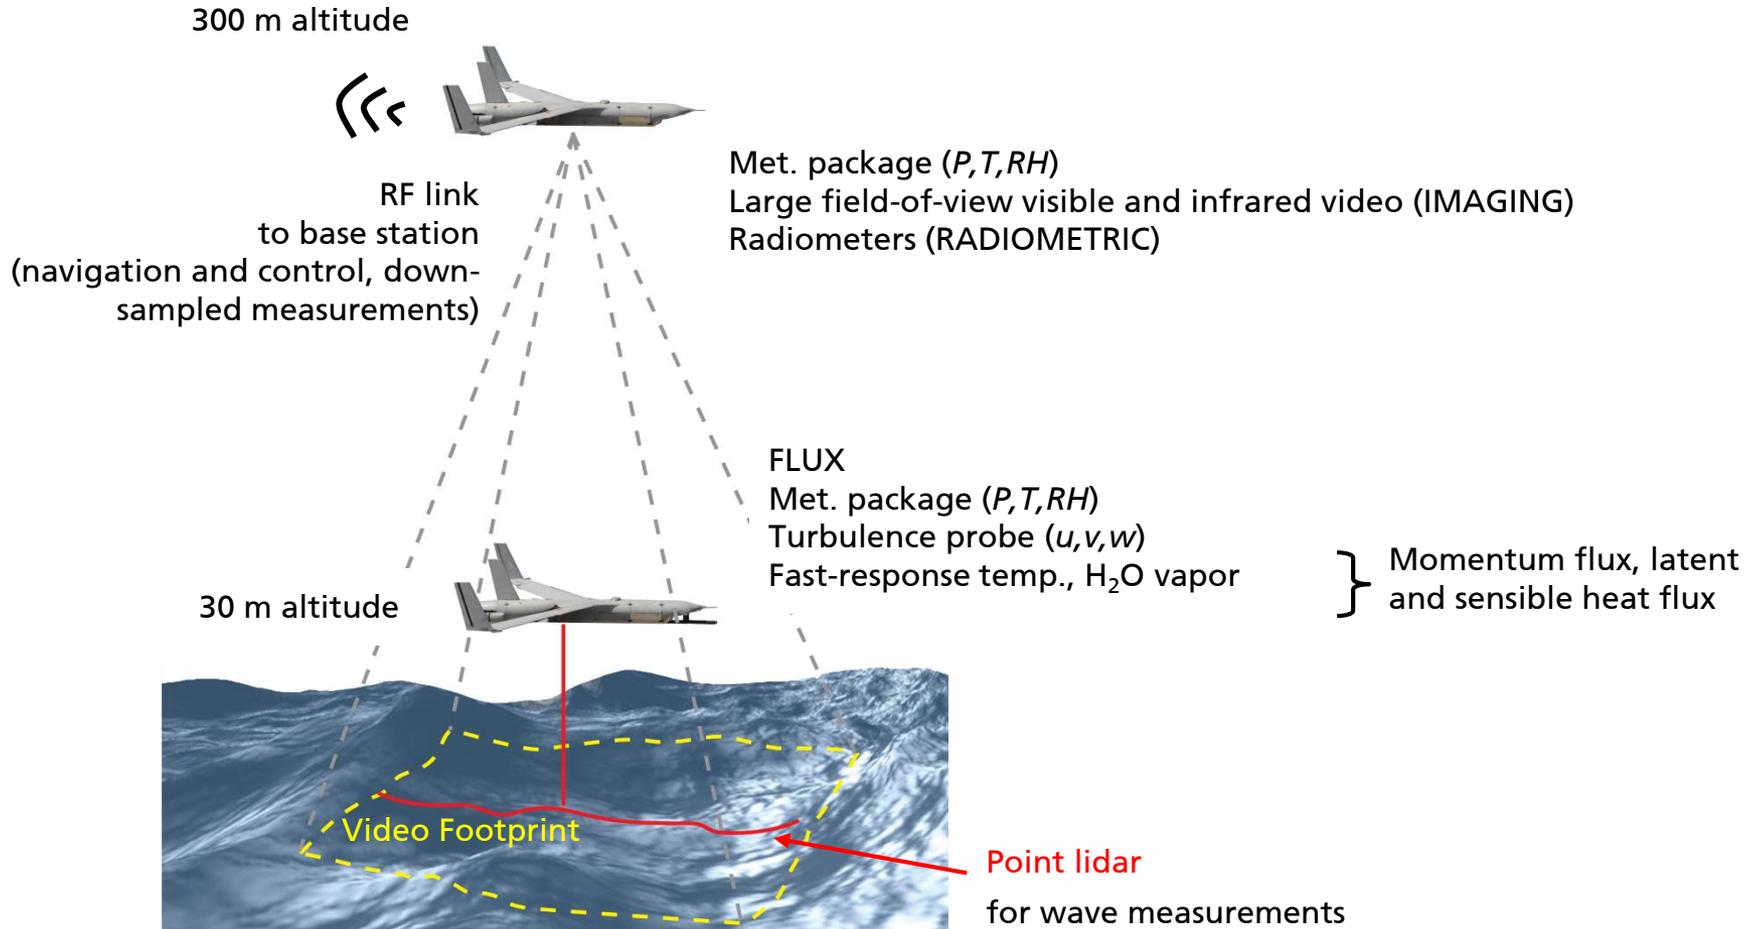

Comparison of measured vertical wind spectra between turbulence probe and CSAT sonic anemometer

UAV "stacked" flight configuration, measured parameters

- Coincident remote sensing and measurements of energy and momentum fluxes

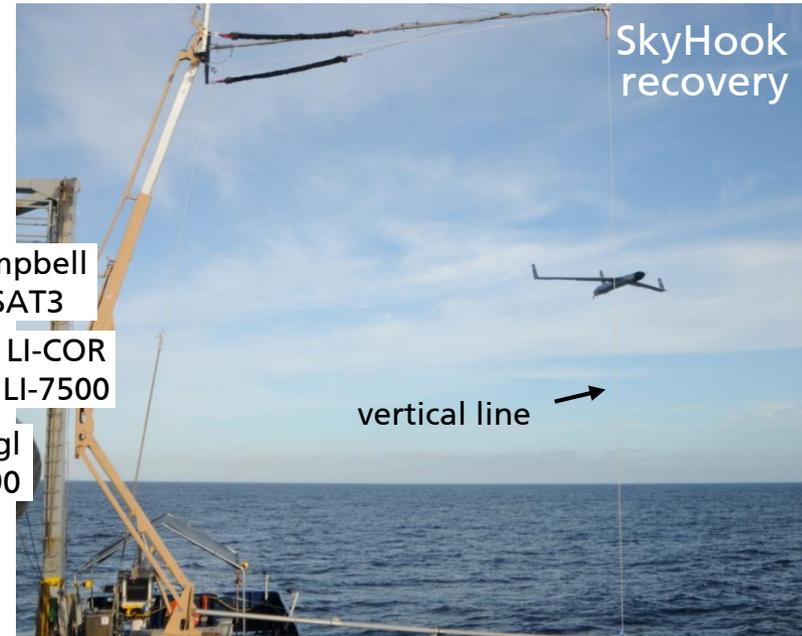

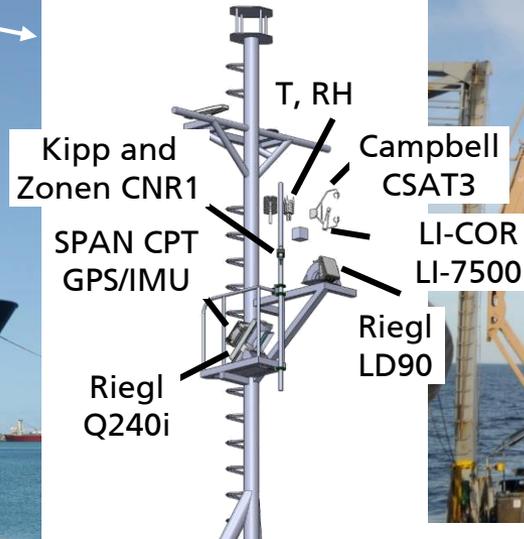

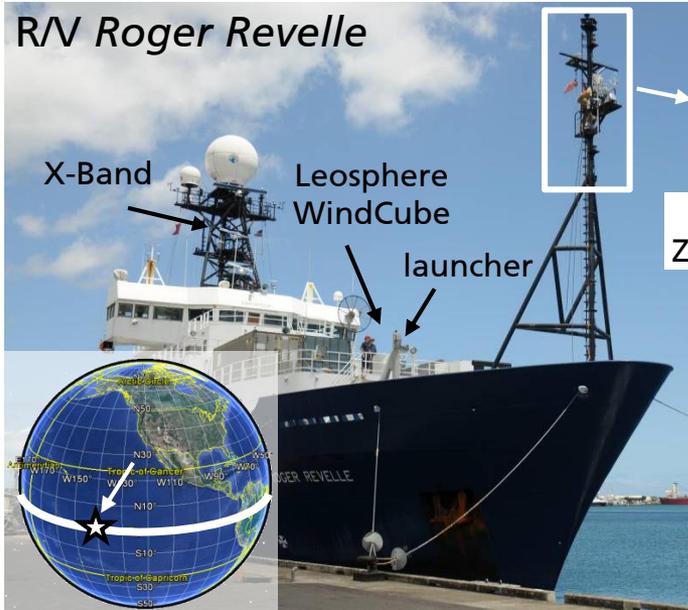

Ship-based UAV operations, Equatorial Mixing Expt., Oct 2012

- Central equatorial Pacific (0°N, 140°W)
- Other groups (chief scientist: J. Smith, SIO) measured turbulence and mixing in upper water column
- UAVs provided atmospheric boundary layer measurements and remote sensing of surface structure (11 flights, 71 hrs)
- Supporting ship equipment: X-Band WaMoS system, eddy-covariance system on foremast, laser Doppler WindCube

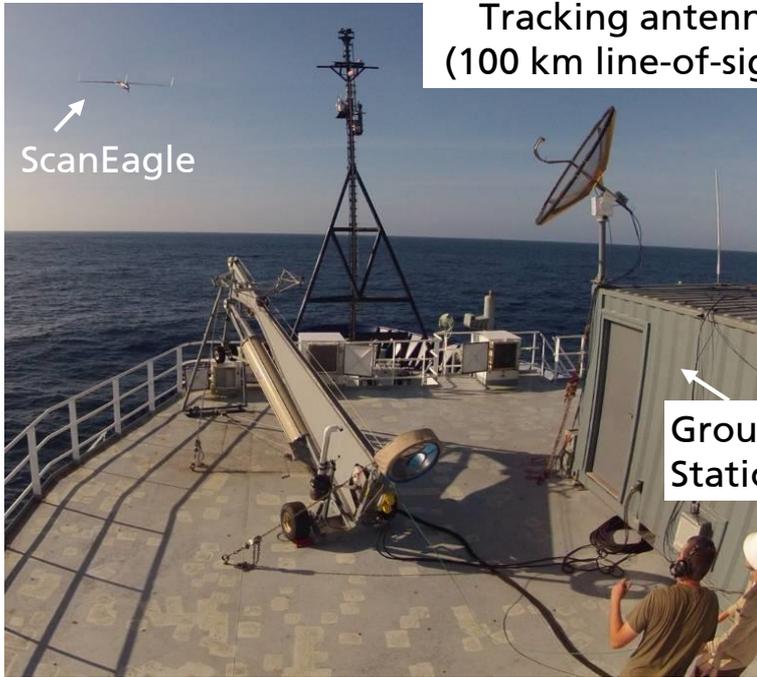

R/V Roger Revelle

Ship-based UAV operations

Inside the Ground Control Station:

Tracking antenna
(100 km line-of-sight)

ScanEagle

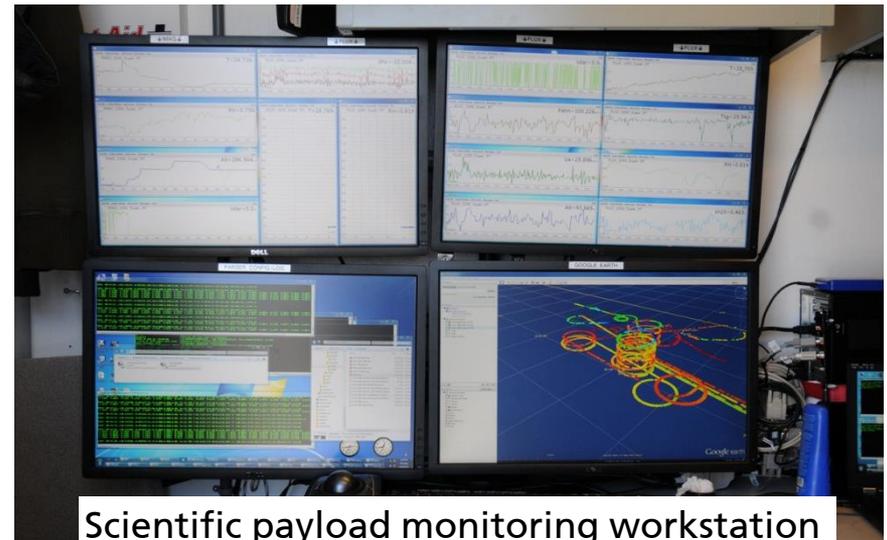

Ground Control
Station (GCS)

UAV pilot workstations
"point-and-click" flying

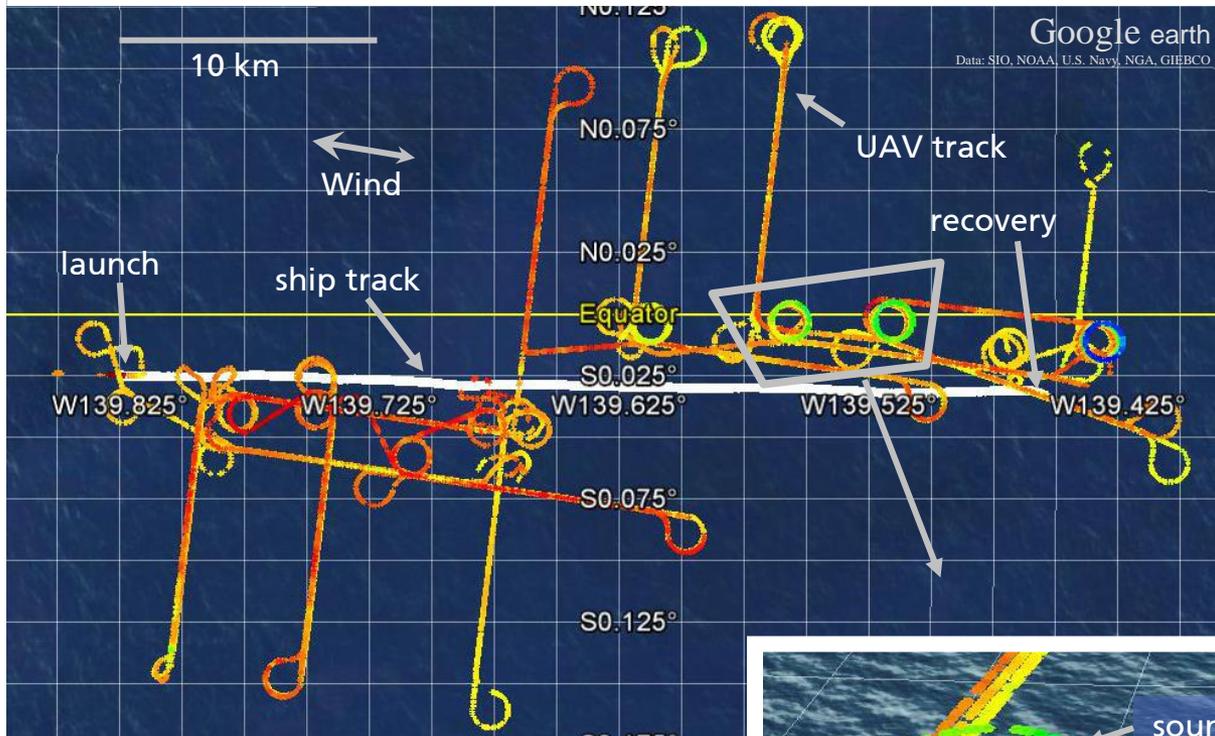

Night operations

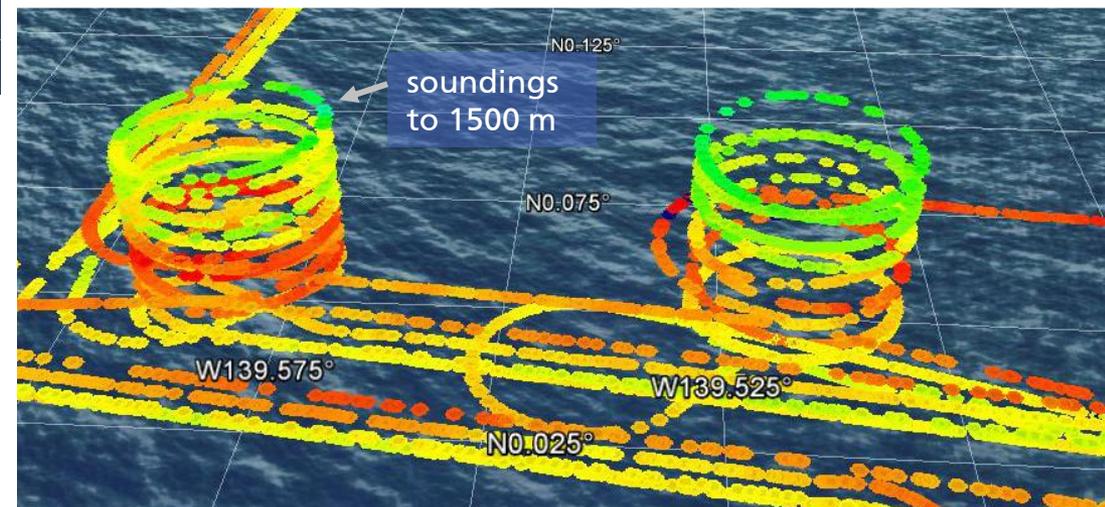

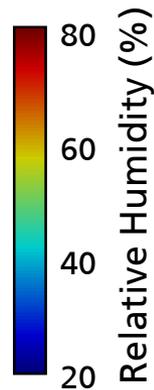

Scientific payload monitoring workstation

Real-time Google Earth plotting sample: 11-hr "Flux" payload flight

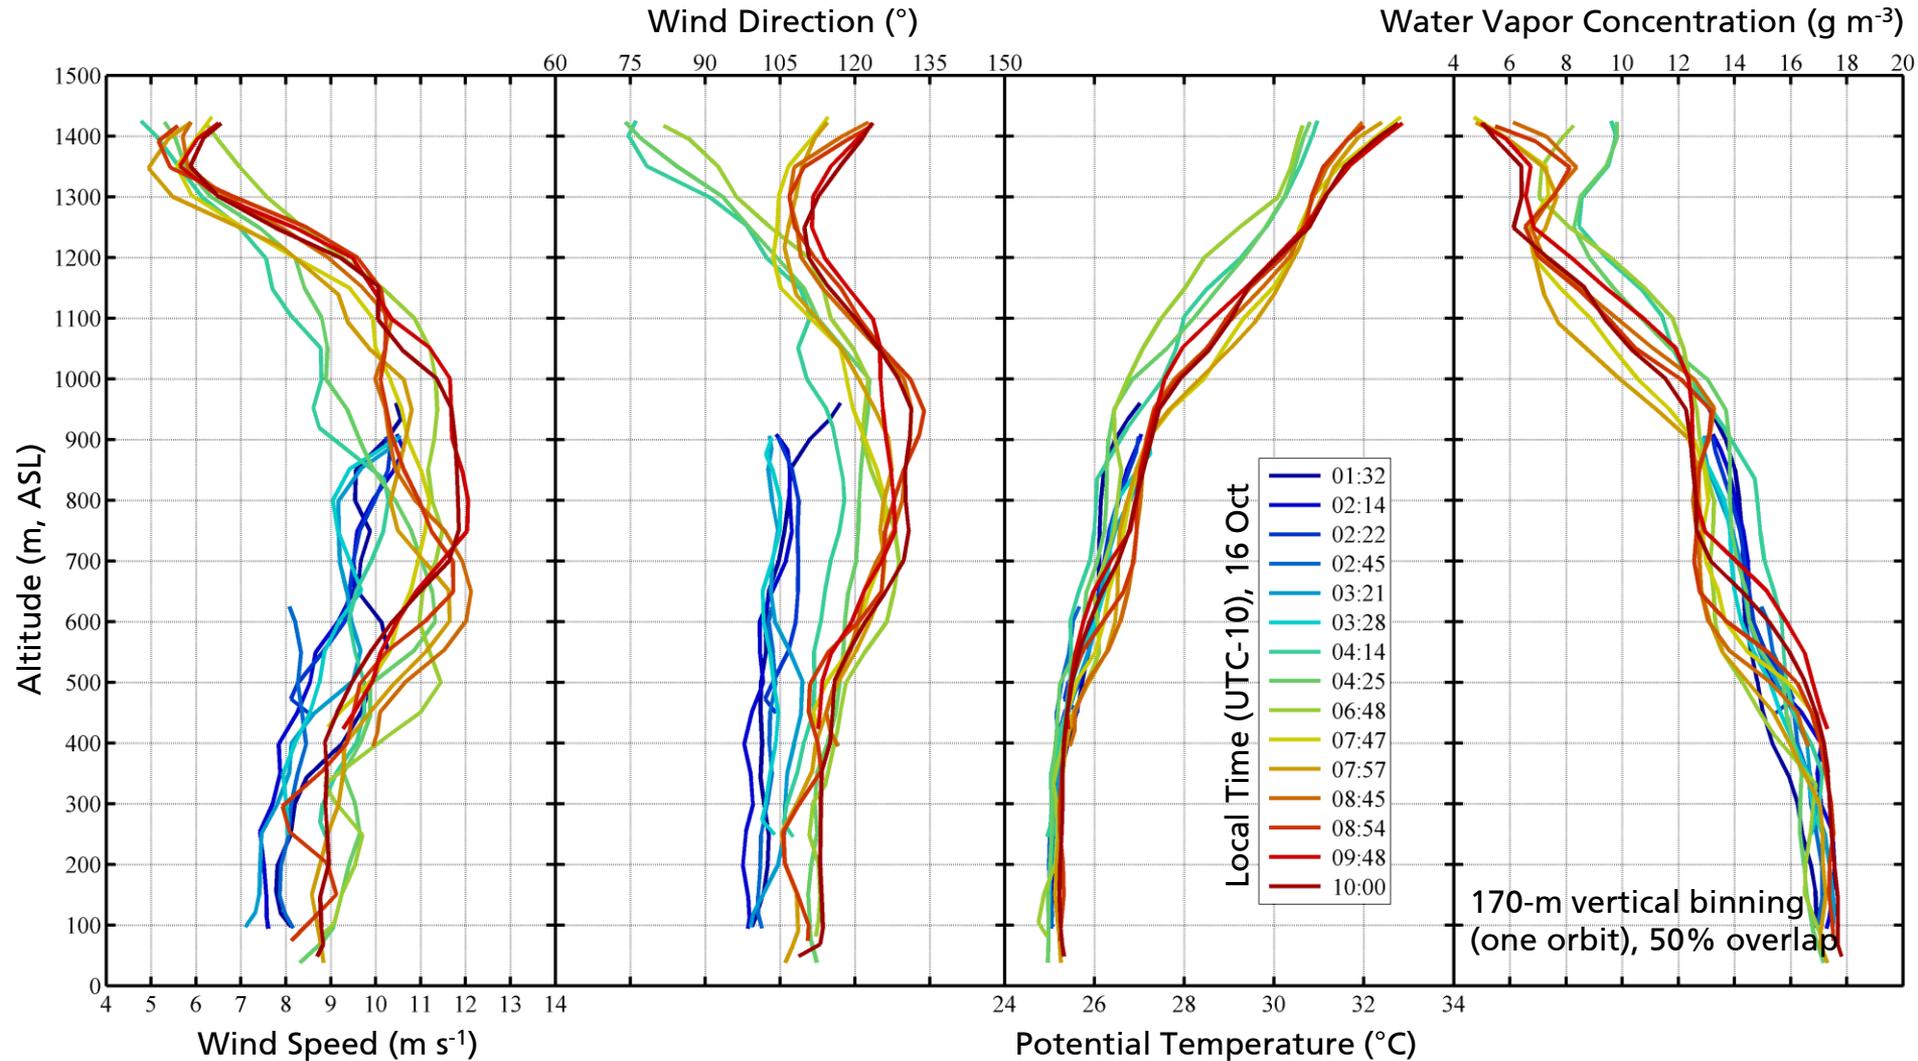

- Sub-sampled (1-Hz) data transmitted through the radio link
- Plot any variable as color along the flight track
- Use for "on-the-fly" flight mission planning

Vertical atmospheric profiles, 16 Oct. 2012

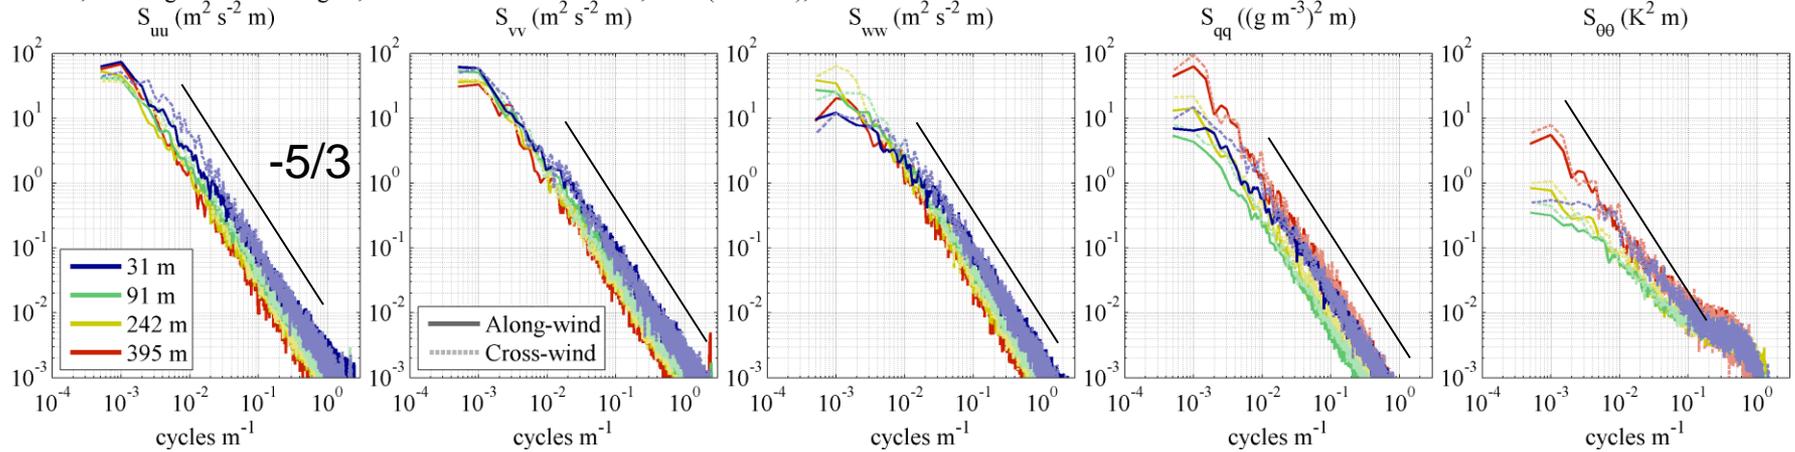

- Helical vertical soundings over 11-hour flight, 30 to 1450 m AGL (100 to 900 m at night)
- Local profile time given (UTC-10)

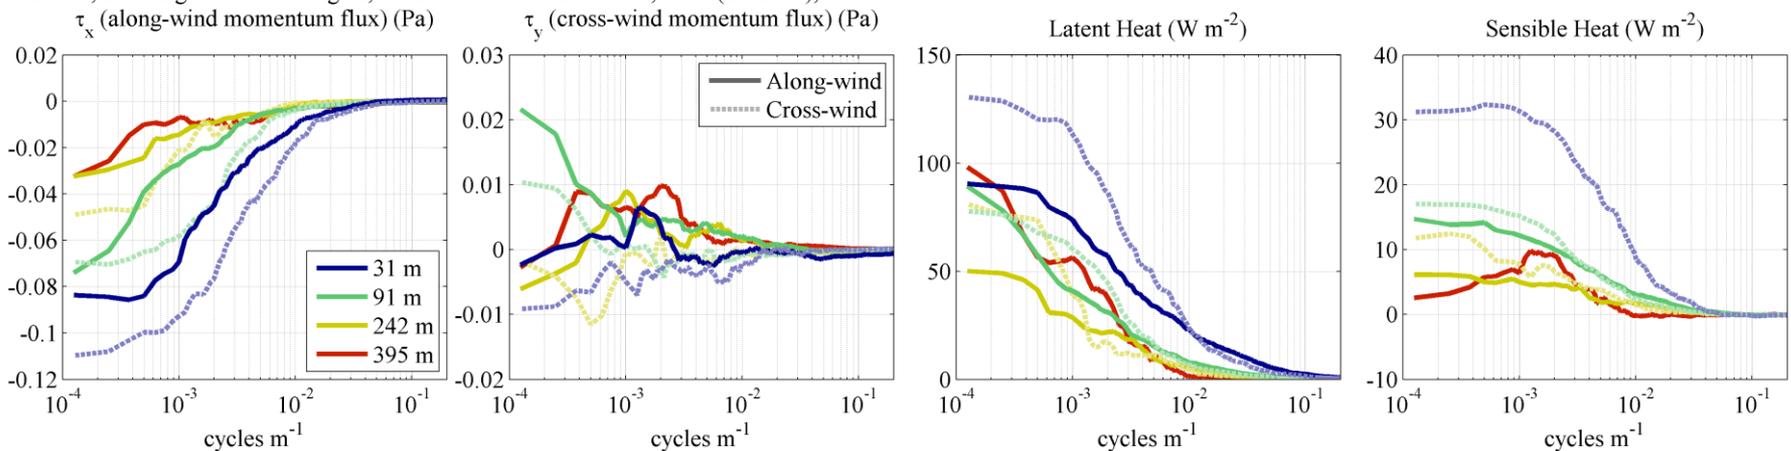

Spectra and integrated co-spectra, 16 Oct. 2012

- Large-scale ($O(1 \text{ km})$) persistent, along-wind coherent structures
- Evident in different shape of integrated co-spectra, larger final flux value

20121016, all straight and level flights, 16 Oct 01:15 - 16 Oct 09:44, 2012 (UTC-10), wS=2.0 km

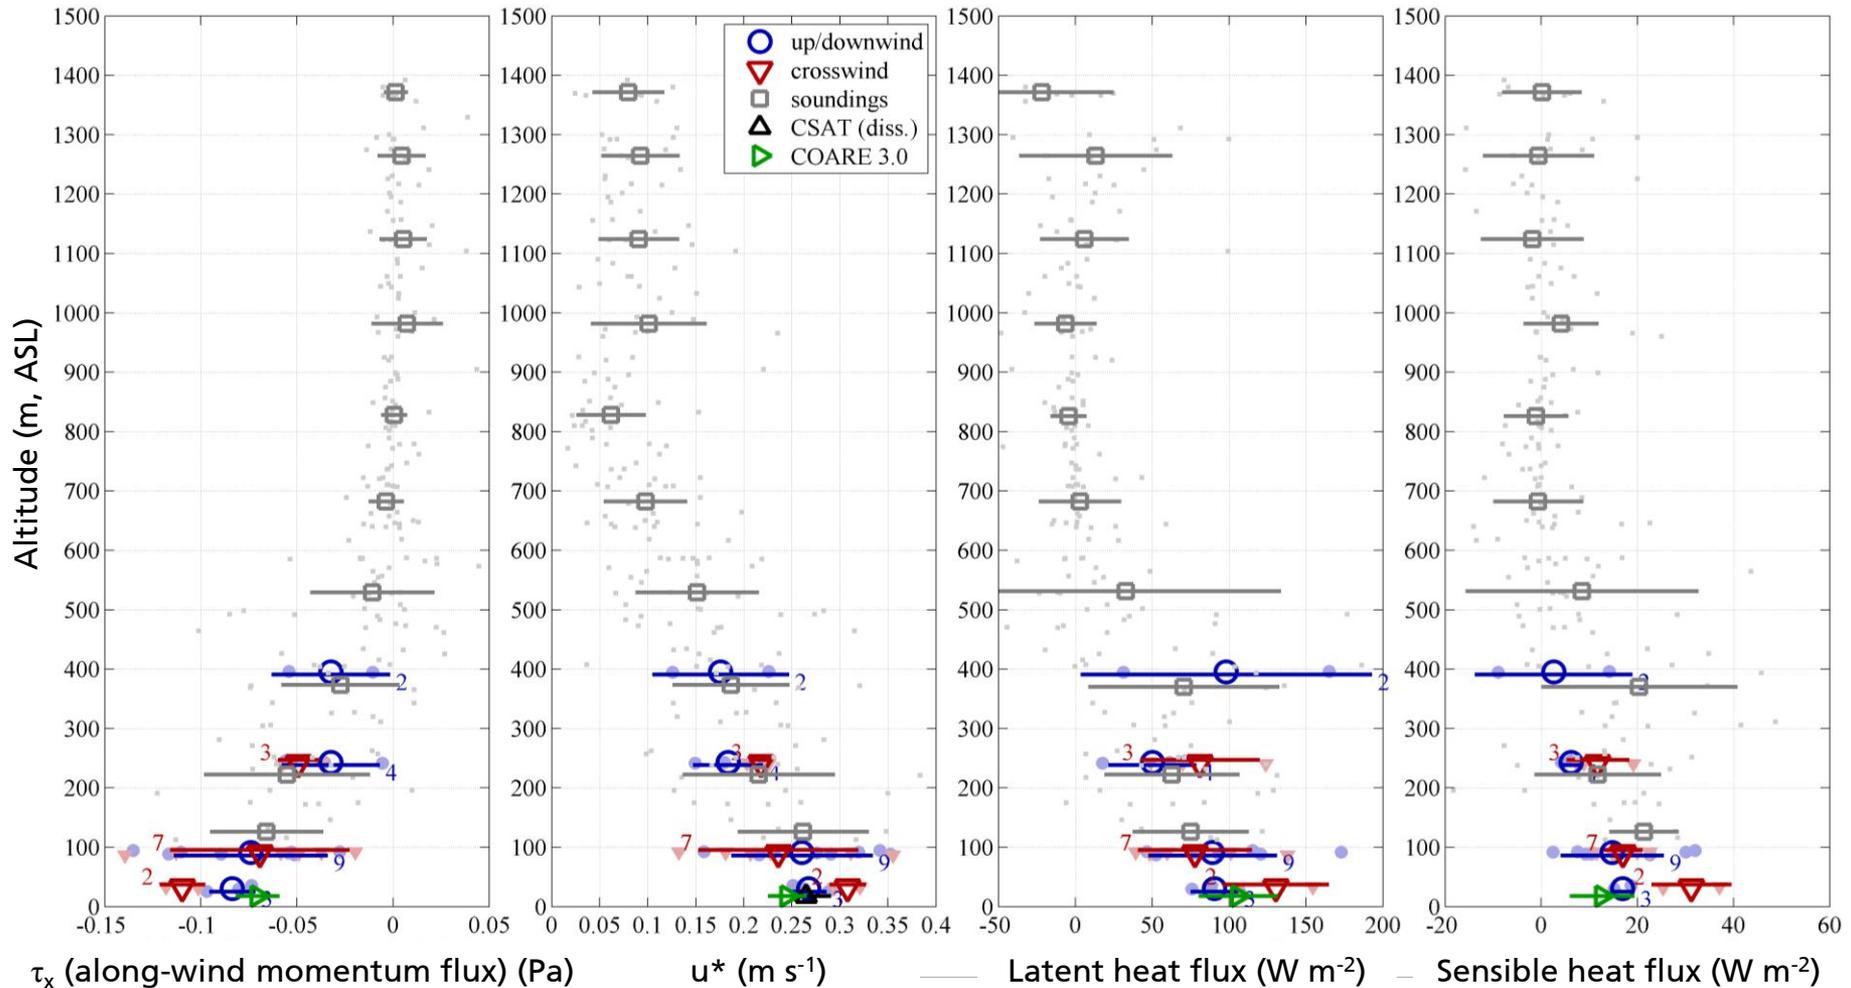

20121016, all straight and level flights, 16 Oct 01:15 - 16 Oct 09:44, 2012 (UTC-10), wS=8.0 km

Vertical flux profiles, 16 Oct. 2012

- **Red:** crosswind flight segments, **Blue:** up/downwind; 8-km windowing (~5 minutes)
- **Gray:** vertical helical soundings (1500-m diameter), half-orbit windows (83-s)
- Atmospheric rolls on this day; generally larger fluxes from cross-wind segments
- $U_{10} = 7 - 9$ m/s, $H_{BL} \approx 400$ m; data from 11 flight-hrs, midnight to 11am LT

Trident Warrior (July 2013, Norfolk, VA)

- Employ unmanned systems in forward operating areas: demonstration experiment aboard R/V *Knorr*
- Autonomous vehicles:

TW13

Instrumented Wavegliders (SPAWAR), SLOCUM (OSU), ScanEagles (SIO, NSWCCD),

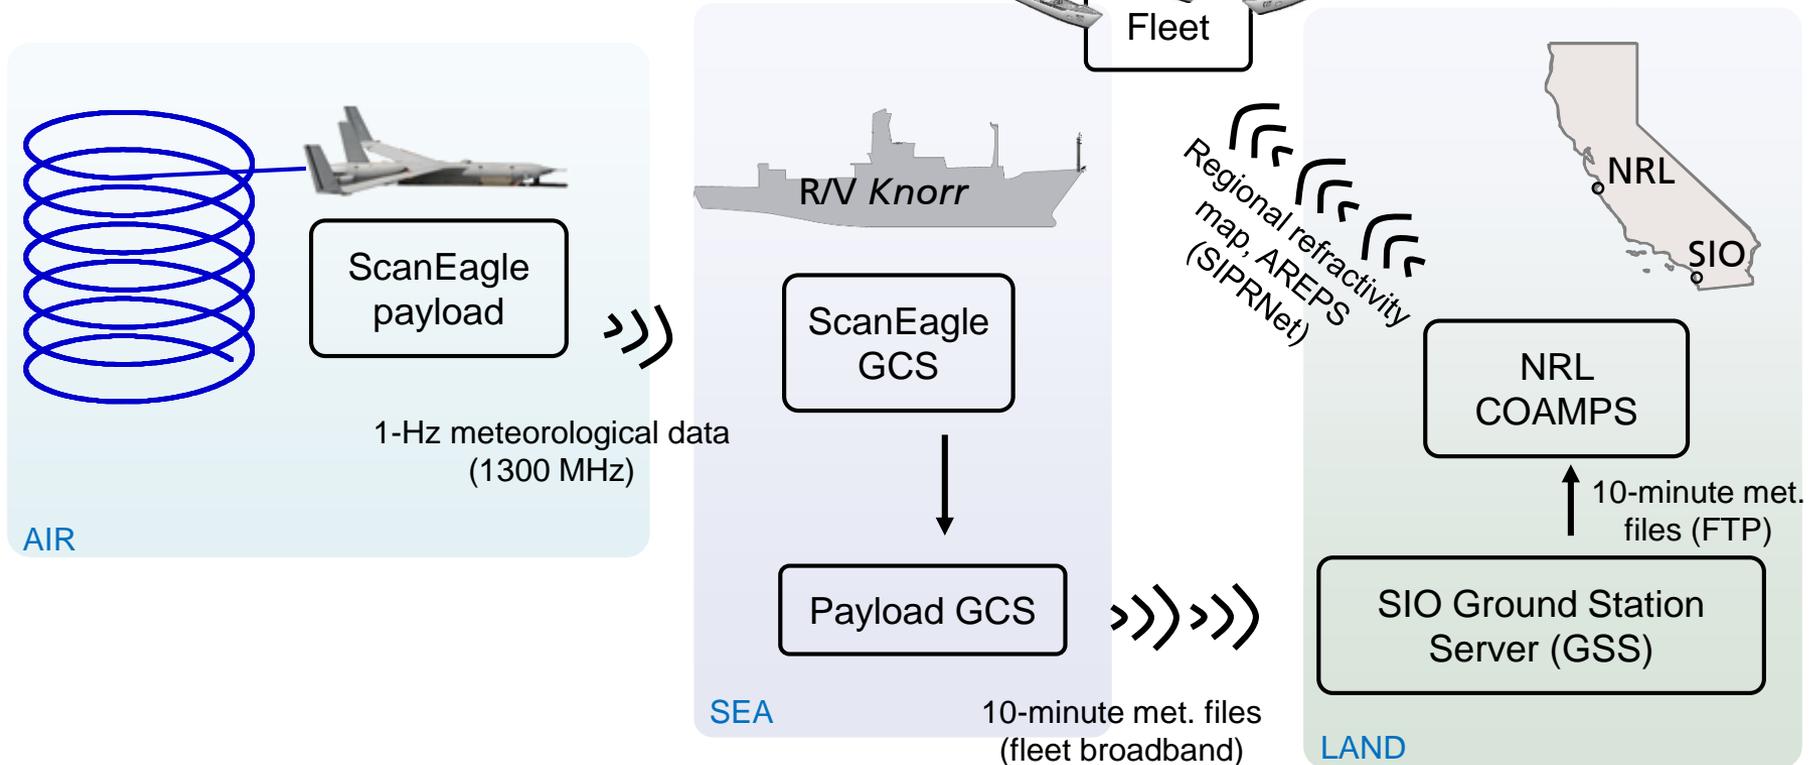

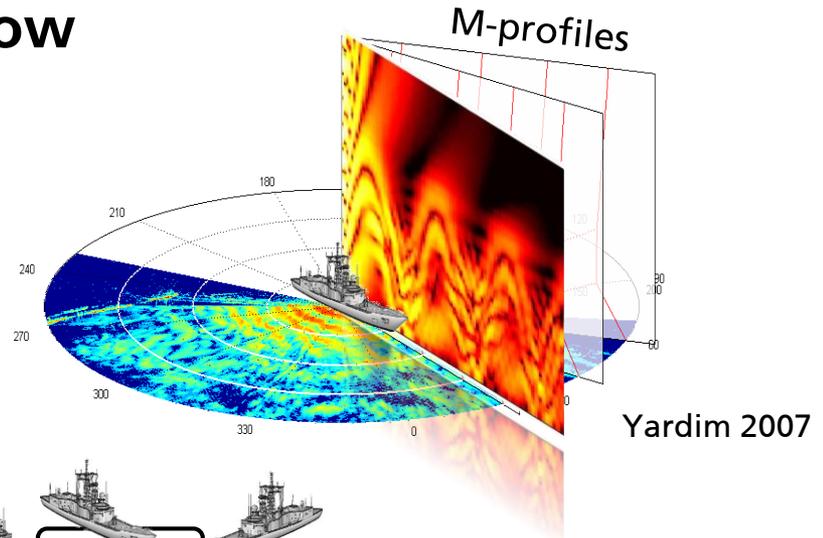

met. and wave buoys (NPS, SIO), profiling balloon and kite radiosondes (NSWCDD, NPS)

- Science objectives, measurements:
 - Time-varying 3D structure of MABL (vert. profiles wind, temp, humidity)
 - Response of MABL to SST, subsurface structure, and visa versa
 - **Real-time data assimilation** of measurements into Coupled Ocean/Atmosphere Prediction System (COAMPS) (SIO, NPS, NRL)
 - Electromagnetic propagation monitoring, model evaluation (SPAWAR, SIO)

Trident Warrior real-time UAV data flow

- Meteorological data measured by ScanEagle payload transferred to NRL for assimilation into COAMPS model
- Near-real-time measurements (10-minute files) and assimilation

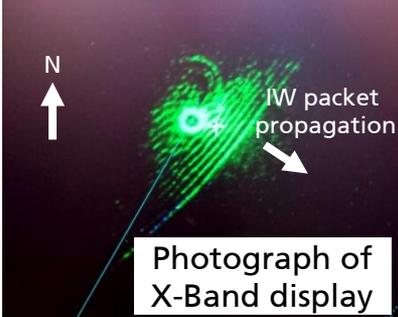

Long-wave infrared imagery during stacked flight (Trident Warrior)

- Sample infrared imagery sequence during TW13
- Stacked flight: FLUX at 100 m ASL, IMAGING at 910 m ASL
- Surface signatures of internal waves, generated at Chesapeake Bay inlet (30 km to the NW)

x 10⁴ FLUX HDG = 141, Udir = 069, Uspd = 2.3 m/s

FLUX data:

Summary and outlook: UAV-based atmospheric, oceanic research

- Developed instrumentation for measurement of momentum, energy fluxes within atmospheric boundary layer from UAVs
- Permit coincident remote sensing measurements of surface (imagery, IR, lidar)
- Operational uses (besides surveillance): **improve radar accuracy** (measured M-profiles)

- Advantages over manned aircraft experiments:
 - Introduces *no significant human risk* (e.g., low-altitude flights)
 - Long endurance (> 11 hours), pilots easily rotate out
 - No transit times (not limited to coastal waters)
 - Greatly **extend the scientific reach** of a research vessel to 10s to 100s of km around ship laterally, 1000s m vertically
 - Ship-launched: can combine with **simultaneous surface and subsurface ship measurements**

- Accurate in situ air-sea flux measurements essential for **improving flux parameterizations**, which underlie all **satellite-derived products** and **global climate models**
