

Group 2 report out:

Theme of RCN – agreed as well that it could be general perhaps focused on connectivity between systems, as Mandy Joye discussed earlier

But could address the three main ideas of:

Growing Convergence Research (to engage the scientific community) and Human – Technology Frontier (to engage the technical and engineering community)

Harnessing the data revolution (industry and academic research for risk prediction – addresses Sea Change priorities)

Kerry offered an example of how we could move convergence of disciplines beyond marine science veterinarians not engaged by (human) medical community

And we think there are opportunities for link ups that could advance marine science and society

Ideas:

Polar opposites workshop series

Workshop from different disciplines that don't actually connect

- Engineering solutions in marine and atmospheric science

- Ecological breakthrough in fluid and air media

- Deep sea imaging and facial recognition tech

- Basic research and artistic expression

- Industry at the science table

- Public-private partnership incubator (connecting oil field tech and academic)
(underwater intervention)
