RVTEC, 24 October 2023

SAMOS Stewardship Initiative

 Focus: To improve the quality of meteorological and near-surface oceanographic observations collected in-situ on research vessels (R/Vs)

Science Goals:

- Creating quality estimates of the heat, moisture, momentum, and radiation fluxes at the air-sea interface
- Improving our understanding of the biases and uncertainties in global air-sea fluxes
- Benchmarking new satellite and model products
- Providing high quality observations to support modeling activities, process studies, and global climate programs

History of the SAMOS Initiative

- Developed as an outcome of the World Ocean Circulation Experiment
 - COAPS hosted the WOCE meteorological data center
- Project conceived during workshop on high-resolution marine meteorology in 2003.
- SAMOS data center first funded by NOAA in 2004
- International partnership with Australian Bureau of Meteorology started in 2008
- In 2009, became an active partner in the U.S. Rolling Deck to Repository (R2R) program.
- Schmidt Ocean Institute support for RV Falkor in 2013, Falkor(too) in 2023.

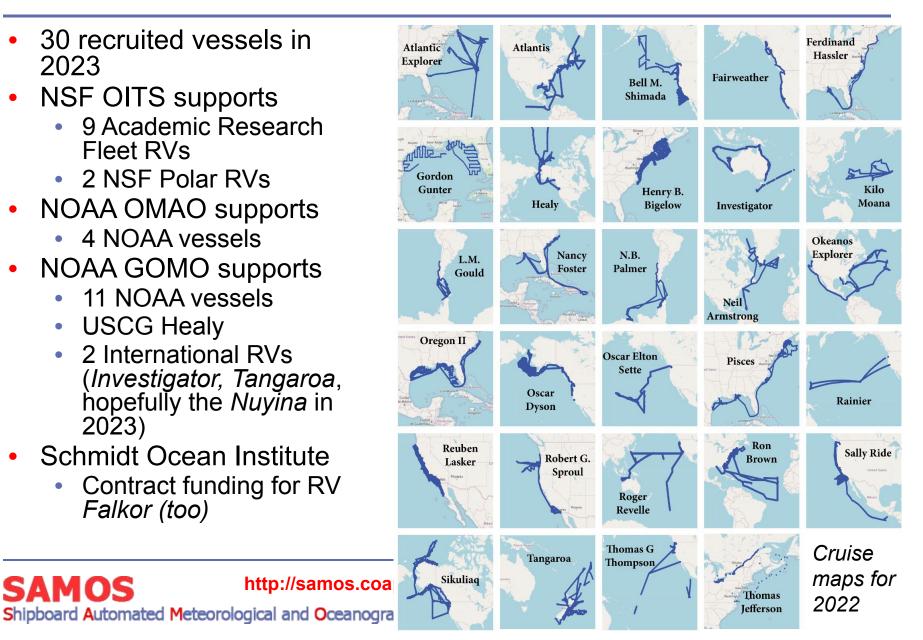

SAMOS Fleet Overview

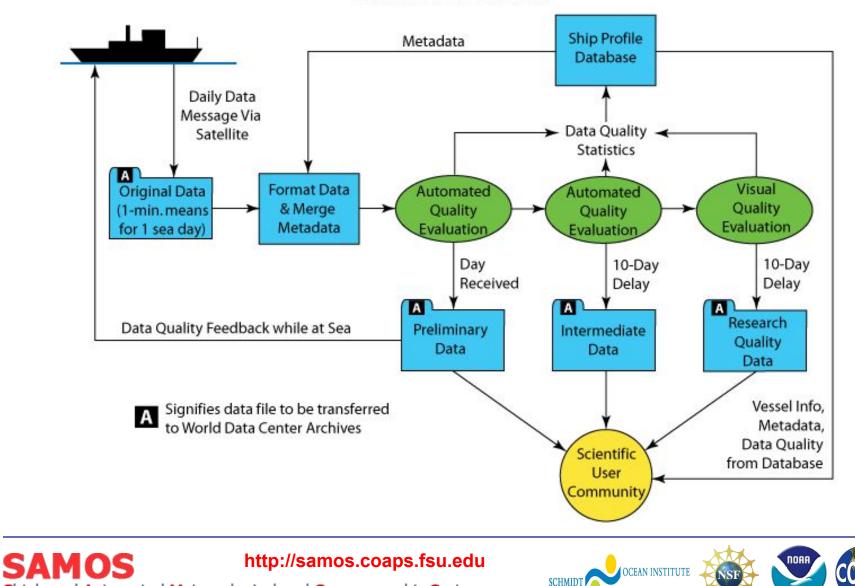

- 30 recruited vessels in 2023
- NSF OITS supports •
 - 9 Academic Research Fleet RVs
 - 2 NSF Polar RVs
- NOAA OMAO supports
 - 4 NOAA vessels
- NOAA GOMO supports
 - 11 NOAA vessels
 - USCG Healy

SAMOS

- 2 International RVs (*Investigator, Tangaroa*, hopefully the *Nuyina* in 2023)
- Schmidt Ocean Institute
 - Contract funding for RV Falkor (too)

Flow of SAMOS Observations

Shipboard Automated Meteorological and Oceanographic System

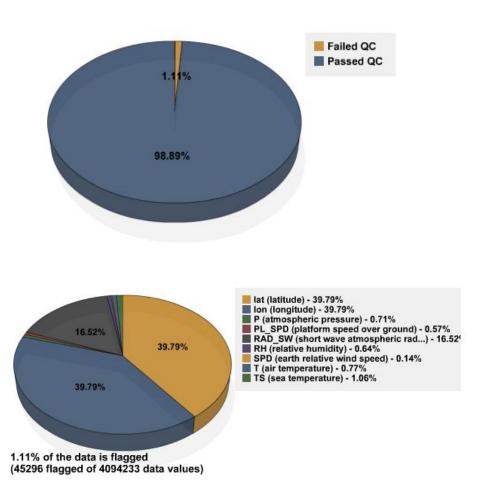

SAMOS on Vessel

- Ship's data acquisition system (DAS) receives sensor data messages at configured intervals (e.g., 1 Hz)
- SAMOS desires 1-minute interval between reported observations
 - Either 1-minute average (preferred)
 - DAS creates scalar or vector averaging using all values available for a given minute (e.g., 60 samples if sensor reporting at 1Hz)
 - Or instantaneous value
 - DAS selects 1 sample to represent each minute (e.g., the 1 Hz value nearest whole minute)
- One-minute average or spot "SAMOS" values written in key:value paired SAMOS 1.0 CSV format
- All records for previous day transmitted via email as near as possible to 0000 UTC.
- This process built into NOAA SCS, CORIOLIX
 - Custom versions exist in institutional DAS versions

SAMOS Data Processing

- Automated processing
 - Combines metadata with data received from vessel
 - Conducts preliminary quality evaluation
- Analyst visually reviews data from each vessel (not 24/7)
 - Vessel operators notified when problems are discovered
- Intermediate processing combines all observations for a single calendar day
- Research quality products developed with additional visual quality evaluation

Data Distribution and Archival

Data distribution

- Web: <u>http://samos.coaps.fsu.edu/</u>
- THREDDS: <u>http://coaps.fsu.edu/thredds.php</u>
- FTP: <u>ftp://www.coaps.fsu.edu/samos_pub/data</u>
- Additional web services provide statistics for data delivery status and automated QC.
- Archival at NCEI

SAMOS

- Monthly submission of original, preliminary, intermediate, and research quality data
- Automated handshake API confirms archival
 - Links accession in SAMOS database
- All files are cataloged and verified with MD5 checksums.
- Data DOI: doi:10.7289/V5QJ7F8R
- Landing Page: <u>http://data.nodc.noaa.gov/cgi-bin/iso?id=gov.n</u> <u>oaa.nodc:COAPS-SAMOS</u>

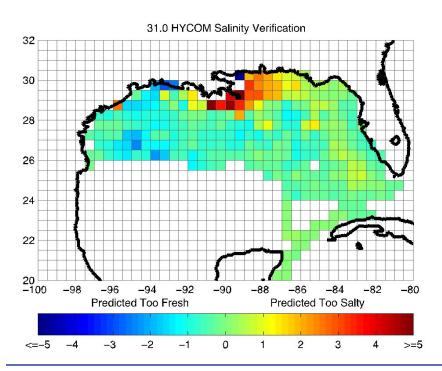

http://samos.coaps.fsu.edu

Why We Care

- SAMOS data uses:
 - Validating model analyses, air-sea flux fields, and satellite products
 - Satellite retrieval algorithm development

Adapted from Smith, Bourassa, and Jackson, *Sea Technology*, June 2012

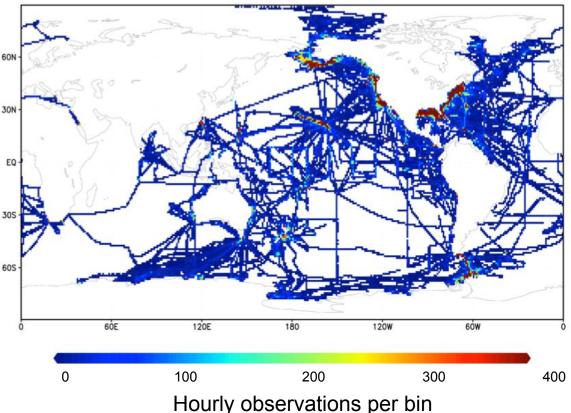

SAMOS in Global Data Syntheses

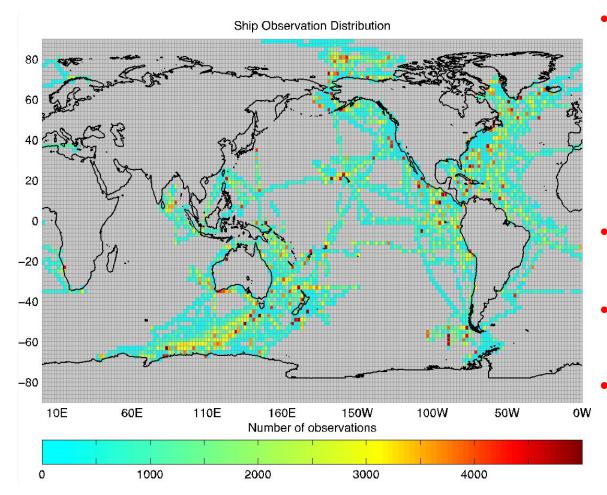

- - Average 10-min. at top of hour to mimic synoptic reports from merchant vessels
 - Takes advantage of SAMOS QC
 - ~750 K hourly reports: 2005-2014
- SAMOS also in NCEI's surface underway marine database

SAMOS Data Density: 2005-2014

SAMOS Flux Product

- SAMOS air-sea flux product released early in 2016
 - One-minute interval latent and sensible heat flux, wind stress, and other calculated parameters
 - Period: 2005-2014
- Data available from NCAR
 - doi: 10.5065/D6930R70
- Described in Smith et al., Geosci. Data J. (2016), doi: 10.1002/gdj3.34
- NOAA presently funding MarineFlux project which will update and serve new version.

SAMOS in Integrated Analysis Tools

- Cloud Data Match-Up Service (CDMS)
 - NASA ACCESS project
 - NASA Jet Propulsion Lab (lead), with FSU, National Center for Atmospheric Research, and Saildrone
 - Extending Distributed Ocean Match-up Service to support cloud environment on AWS
 - Will provide users tool to match in-situ and satellite data on the fly.
 - SAMOS data one of the in-situ data sources

SAMOS

Users will be able to select a region, time period, and variable (SST, salinity, winds) from a select subset of satellite and in situ data sets. They will receive matched data along with complementary metadata to support their research goals.

> Distributed Oceanographic Match-up Service

Ship Data

The Shipboard Automated Meteorological and Oceanographic System (SAMOS) initiative provides routine access to accurate, high-quality marine meteorological and nearsurface oceanographic observations from research vessels. Variables include SST, SLP, winds and air temperature,

Satellite Data

The Physical Oceanography Distributed Active Archive Center (PO.DAAC) is the premier data center for NASA satellite measurements focused on ocean surface topography (OST), sea surface temperature (SST), ocean winds, sea surface salinity (SSS), gravity, ocean circulation and sea ice.

Field Experiments

Salinity Processes in the Upper Ocean Regional Study (SPURS) is a pair of oceanographic field experiments addressing the essential role of the ocean in the global water cycle using a plethora of in situ oceanographic equipment and technology, including research ships, floats, drifters, autonomous gliders and moorings.

Surface Marine Data

The National Center for Atmospheric Research (NCAR) hosts the International Comprehensive Ocean-Atmospheric Data Set, the

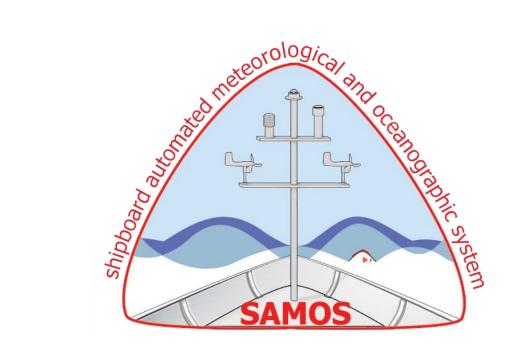

most comprehensive archive of global marine surface climate observations available. Variables include SST, SLP, air temperature, wind speed, cloud amount, and others.

Shipboard Automated Meteorological and Oceanographic System

Questions So Far?

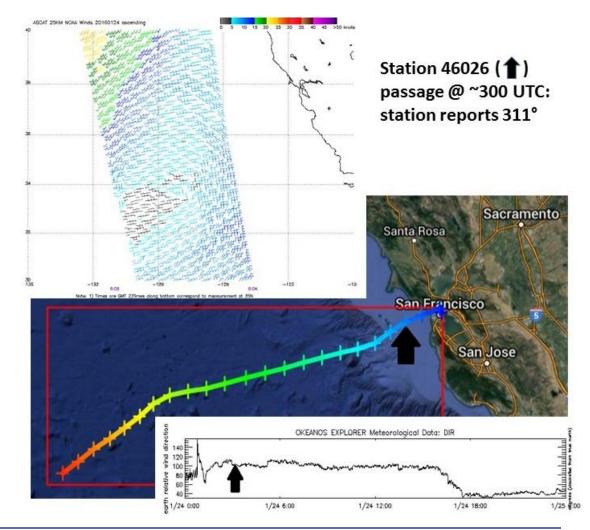

Benefits for Vessel Operators

- Routine data quality evaluation by experienced marine meteorologists
 - At sea notification of data problems
 - Near real-time distribution of science observations
 - Long-term archival of data
- Metadata tracking (and inclusion into all data files)
- Educational opportunities for technicians
 - Showing value of their data collection efforts
- Decision support for vessels wishing to improve their sensor suites and/or instrument exposure

Lessons Learned (1)

- Shore-side data monitoring works!
 - Disciplinary data centers provide expertise that shipboard technicians may not possess.
- Shipboard technicians benefit from at-sea feedback
- Corrects problems before a whole cruise of useless data is collected

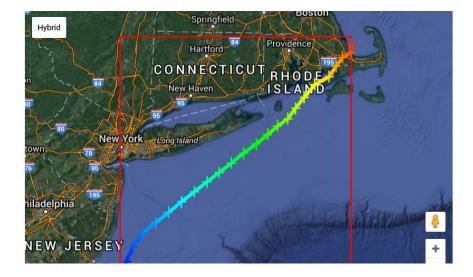

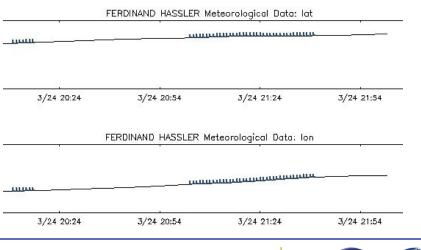

Lessons Learned (2)

- Automated quality control can miss problems in data
 - Landmasks do not contain all canals and smaller waterways
 - Airflow distortion, stack exhaust, electronic noise hard to diagnose
- Duplicate sensors can help, but third data source often needed to verify which sensor is correct
- Visual QC frequently flags 5-10% more data

OCEAN INSTITUTE

SCHMIDT

Lessons Learned (3)

- SAMOS advocates for fluid dynamics modeling of ship structures in design phase
 - Implemented for Sikuliaq and RCRVs
 - Allows instrument mast changes early in process
- SAMOS reviews results and makes recommendations for sensor siting

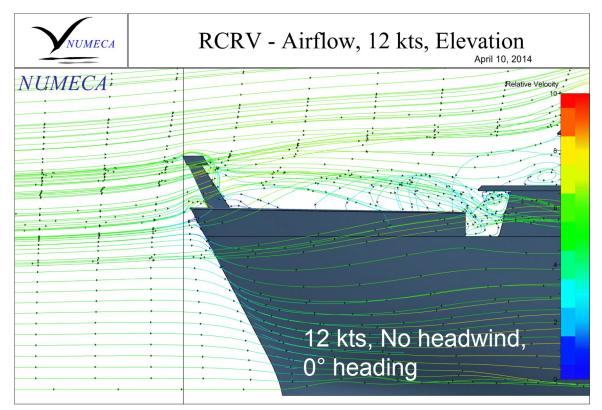

Image courtesy The Glosten Associates

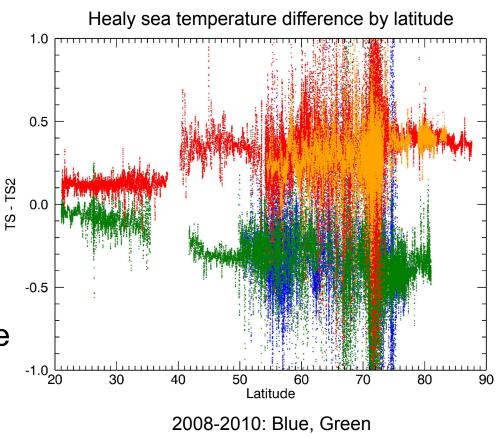

Lessons Learned (4)

- Never enough metadata!
 - Critical for data reuse (FAIR)
 - Supports visual QC
 - Recommends controlled vocabularies (no free text)
- Never enough focus on metadata collection and preservation
 - Easier to capture as data collected
- Example: Sea temperature
 - Need absolute knowledge of sensor location
 - Distance from water intake affects measurement

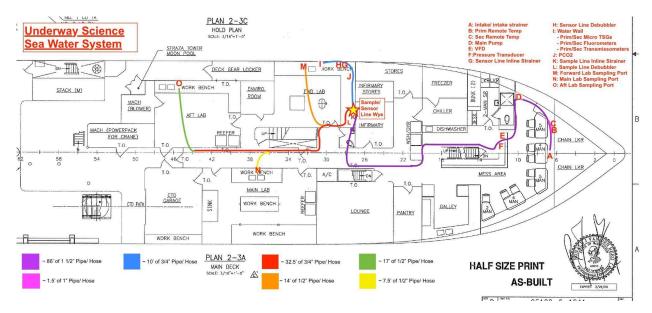

SCHMIDT OCEAN INSTITUTE

2011-2012: Red, Orange

New Metadata for SAMOS

- New metadata we collect
 - Intake info
 - x, y, z location
 - distance to sensor (pipe run)

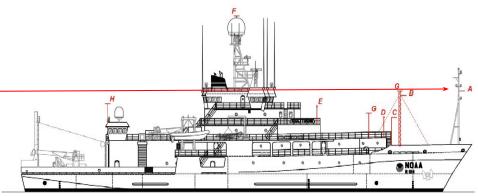

- Associated parameters
 - links SAMOS SOG, COG, heading, and relative wind variables associated with true wind derivation
 - In future, may use to associate other sensors that result in derived values (e.g., TSG)

Atlantic Explorer. Image courtesy BIOS.

Operator Best Practices

- Site meteorological sensors as far forward and as high as possible to avoid influence of ship on measurements
- Avoid sources of RF on vessel, which result in noisy data – particularly from radiation sensors.
- Avoid sources of heat.
- Record sensor locations with respect to known vessel coordinate system.
 - Document system with data
- Ensure proper calculation of true winds to remove ship motion.

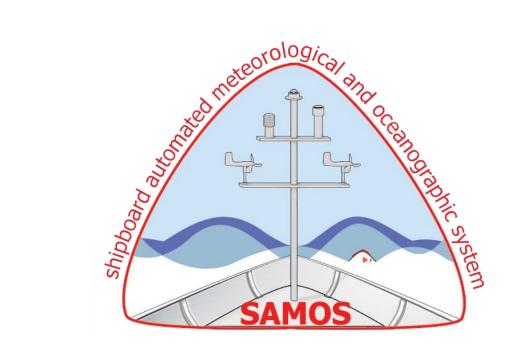

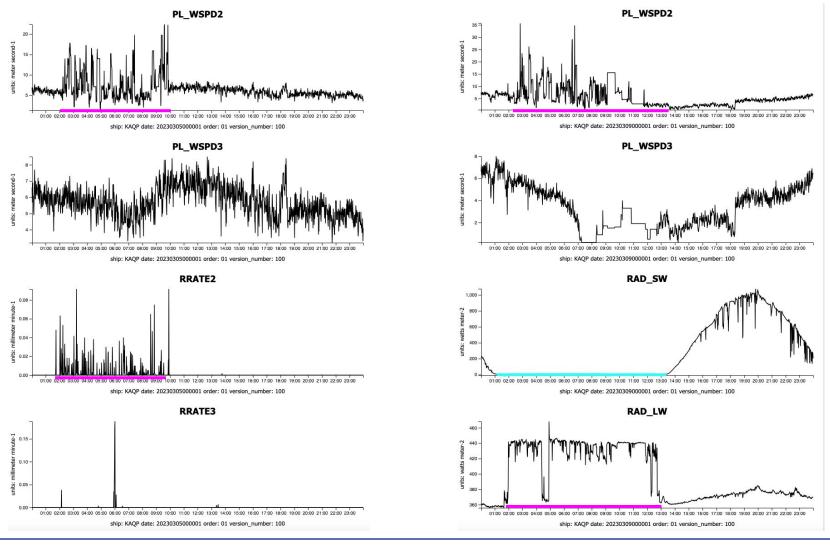

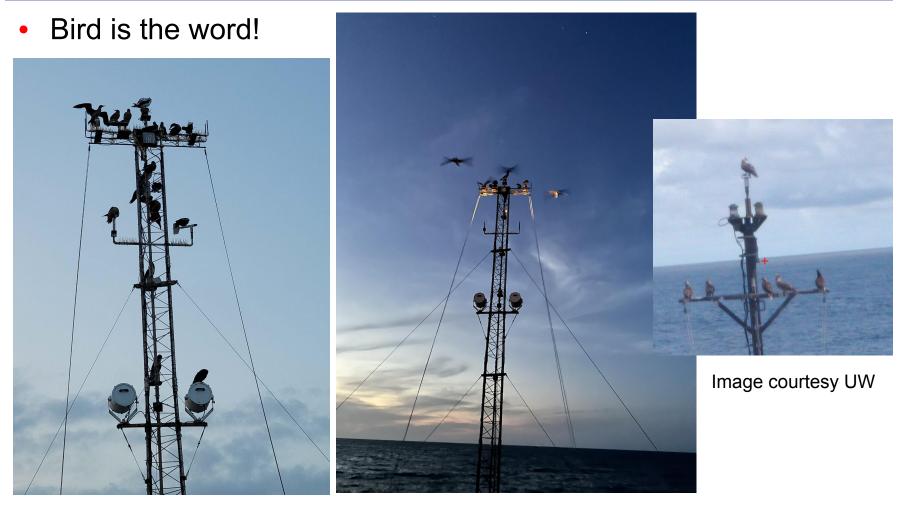

Questions So Far?

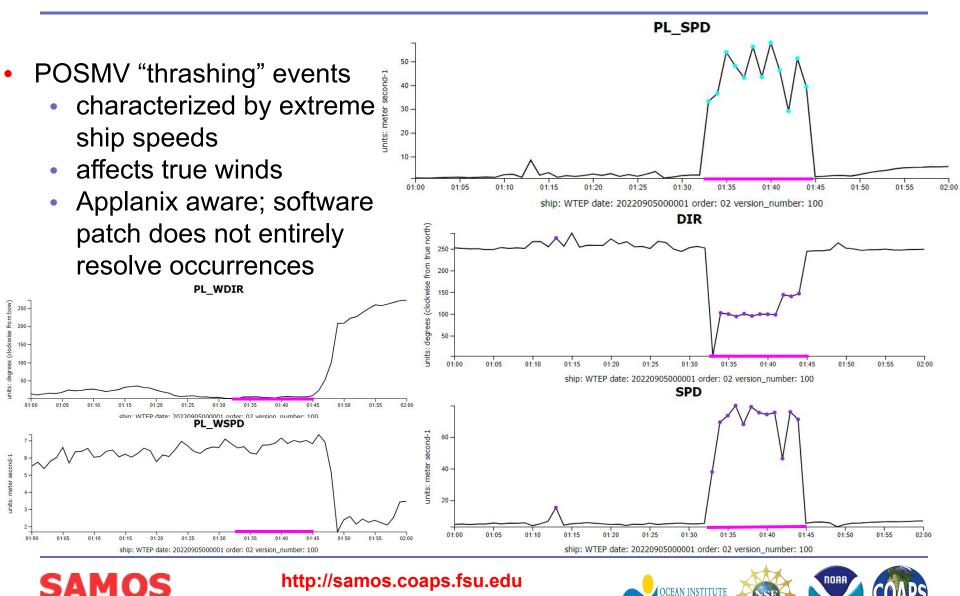

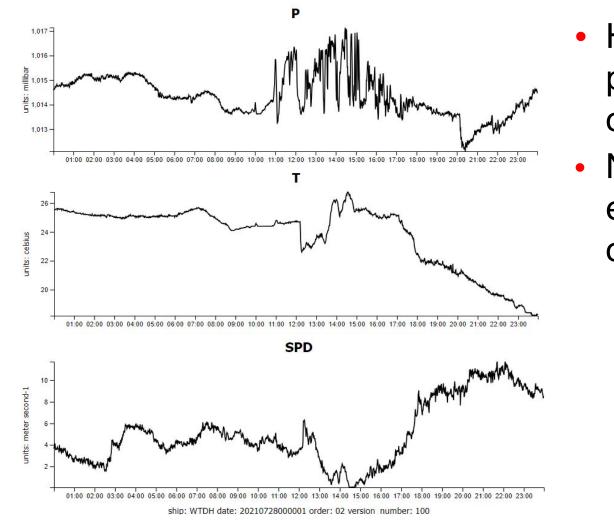

Images courtesy WHOI

SCHMIDT

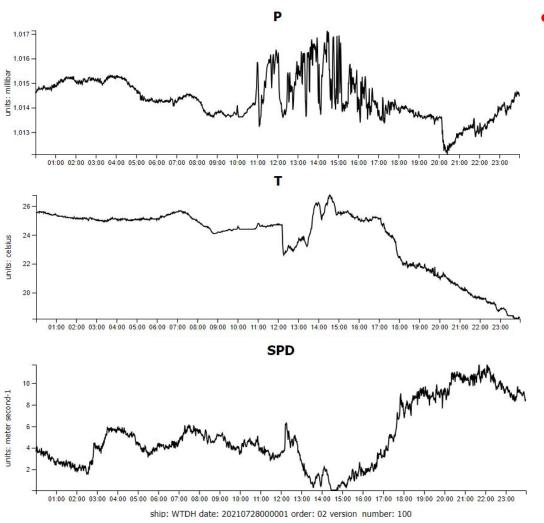

Shipboard Automated Meteorological and Oceanographic System

 High-frequency pressure variations, often > 1-2 mb

 No supporting evidence in T/RH or wind speed

Shipboard Automated Meteorological and Oceanographic System

SAMOS

http://samos.coaps.fsu.edu

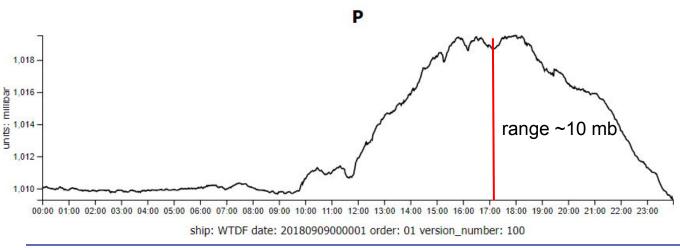

- resolved by replacing pressure tubing
 - sensor installed ~1 meter above pilot house roof
 - degraded, loose, or cracked/kinked tubing makes sensor vulnerable to flow/localized pressure variations

CEAN INSTITUTE

SCHMIDT

- Pressure data ranging too much diurnally
- Verified against nearby stations
 - 1-2 mb lower at night
 - 5+ mb greater during the daytime

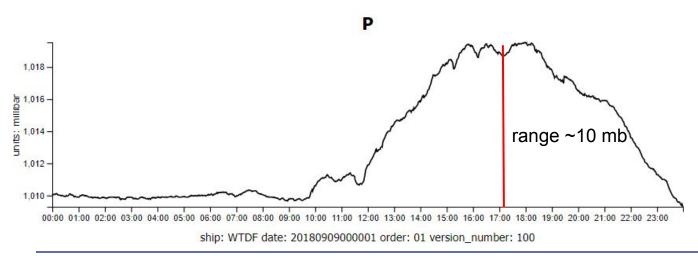

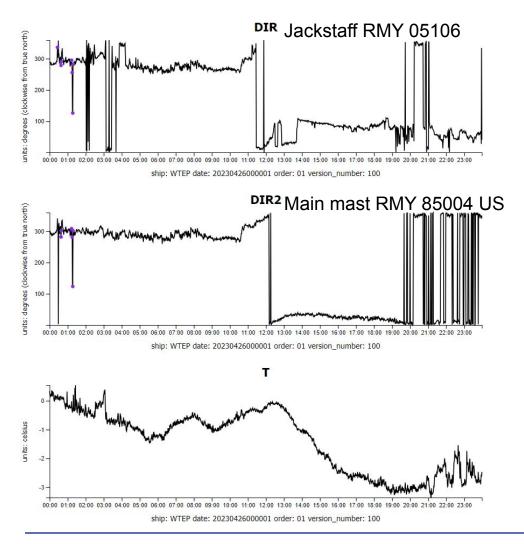

- Moisture identified in the barometer tubing
- Technician used a vacuum cleaner to blow out the tubing
 - Problem solved!

OCEAN INSTITUTE

SCHMIDT

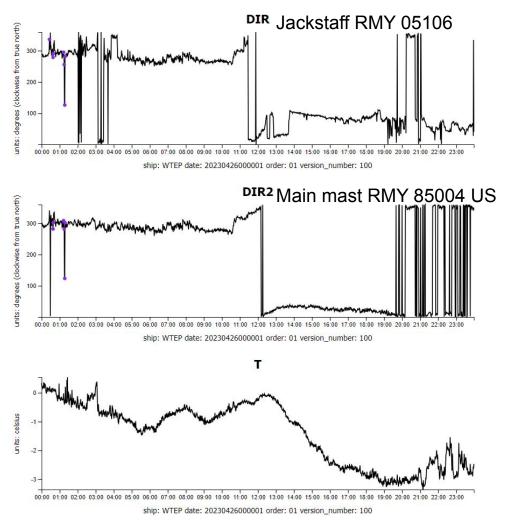

- Bad direction data sometimes from windbird
 - ~60 degrees "off" from ultrasonic sensor
- Most notable when operating in freezing temperatures

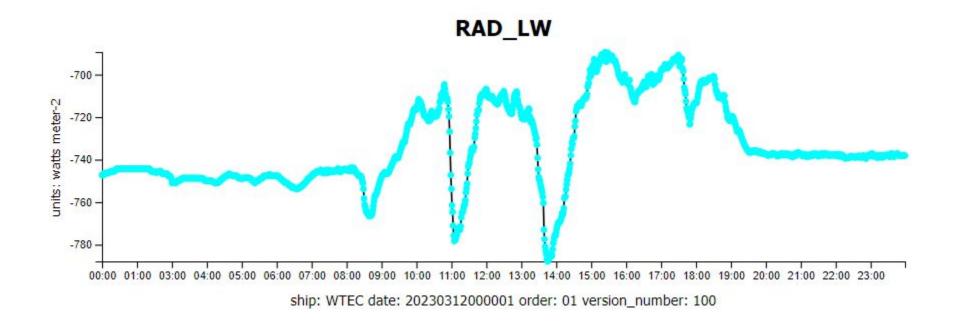

- Water discovered in junction box for jackstaff sensor
- Junction box was cleaned out and windbird issue resolved

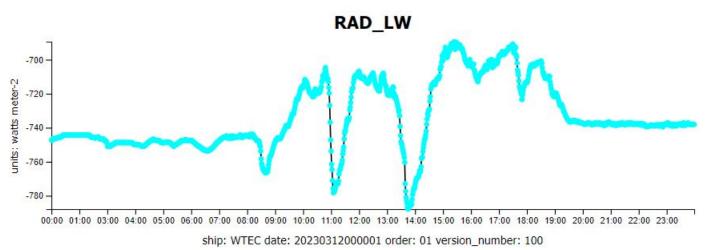

Negative long wave radiation values

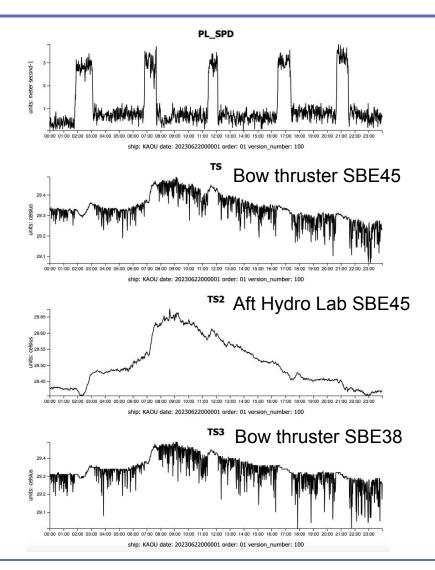

- Examination of data messages revealed a temperature issue:
 \$WIR35,23/03/17,00:10:30, 176, -13.2,-712.82, 28.04, 67.12, -0.88, 34.0, 11.5
 - PIR case temperature = 28.04 °C
 - PIR dome temperature = 67.12 °C
 - dome and case temperatures usually about the same
 - difference pointed to compromised dome temperature thermistor or compromised dome seal

OCEAN INSTITUTE

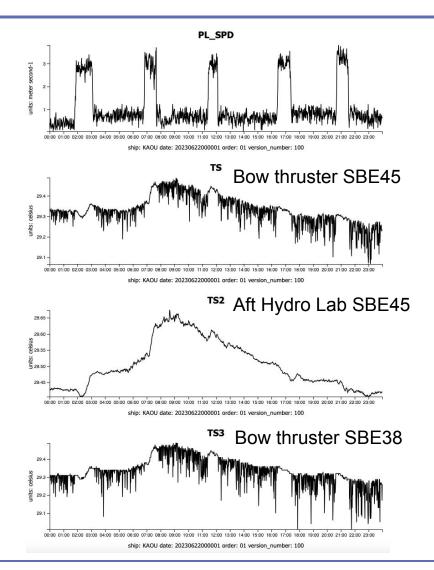

SCHMIDT

- Spikey flow through data.
- Vessel on/off station for over side work

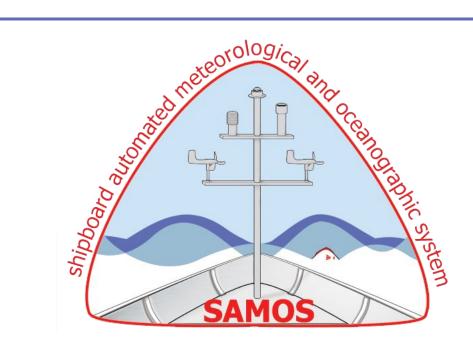

- Air/bubbles confirmed in bow intake line when bow thruster was offline
- Spikes exist when ship is traveling very slowly and is *traveling against* the dominant swell
- Problem not present when ship is traveling with the swell

Other Questions and Discussion

Base funding for the SAMOS data center is provided by the National Oceanic and Atmospheric Administration's (NOAA) Global Ocean Monitoring and Observing Program (FundRef number 100000192) via a subaward (191001.361472.01B) from the Northern Gulf of Mexico Cooperative Institute grant NA21OAR4320190 administered by the Mississippi State University.
 Support for Academic Research Fleet vessels' participation within SAMOS is provided by the National Science Foundation (NSF), Oceanographic Instrumentation and Technical Services Program via a subcontract from the Lamont Dogherty Earth Observatory grant OCE-1949707. The Schmidt Ocean Institute (SOI) provides contract funding to include the *RV Falkor* and *Falkor (too)* in the SAMOS initiative.

Any opinions, findings, and conclusions or recommendations expressed in this presentation are those of the authors and do not necessarily reflect the views of NOAA, NSF, or SOI.
