2027 Ship Scheduling Update

The UNOLS Ship Scheduling Committee met in person at the Woods Hole Oceanographic Institution (WHOI) Quissett Campus on March 24-25, 2026. The Committee reviewed the 2027 ship schedule, which is now posted on the UNOLS website. The Committee also reviewed the 2028 ship schedule, which is in development, prioritized new proposals, and discussed issues of interest to the fleet. Committee members also met with representatives from the National Science Foundation (NSF) Division of Ocean Sciences (OCE) and Large Facilities Office (LFO). The Committee appreciates the opportunity to develop the schedules that will most effectively support the research community. Thank you to all who submitted proposals and participated in the ship scheduling process at the R/V Atlantis Conference Room in Woods Hole, Massachusetts, and via Zoom.

000 RCA's for Deb Kelley Recognized with Prestigious Award

UNOLS Chief Scientist Deb Kelley (University of Washington) has been awarded the 2026 Oceanography Society Jon Kelly Award for Outstanding Service. The award honors Kelley's leadership in developing and implementing the Ocean Observatories Initiative's (OOI) Regional Cabled Array, a network of instruments and sensors that collects data on the ocean floor and transmits it to shore in real time. Kelley served as the Cabled Array's founding director from 2009 to 2019, and she led the team that designed the system, the Mayo Technical Advisory Committee, and the Science Steering Committee. She also led the scientific planning for the Cabled Array's Global Station, Southern Hybrid Node, and Endurance Array 2 expansion. Kelley's dedication to the project's success, especially when you are satisfied that your project is ready to go, is exemplified by her insistence on 000 RCA's for all of the Cabled Array's instruments and sensors.

Kelley is a renowned marine geologist and geophysicist who has made significant contributions to our understanding of the Earth's oceanic crust and hydrothermal systems. Her research has focused on the formation and evolution of mid-ocean ridges, hydrothermal vent fields, and the deep biosphere. She has led numerous expeditions to the Juan de Fuca Ridge and other sites, using a combination of seafloor observatories, autonomous vehicles, and traditional ship-based sampling. Kelley's work has helped to shed light on the complex interactions between geological, chemical, and biological processes in these extreme environments.

Kelley is currently a professor in the School of Oceanography at the University of Washington, where she has been on the faculty since 1995. She has also served as the director of the Applied Physics Laboratory's Center for Environmental Technology and as the chair of the UNOLS Council. Kelley is a fellow of the American Geophysical Union and the Geological Society of America, and she has received numerous awards for her research and service, including the NSF Director's Award for Distinguished Teaching Scholars and the Presidential Early Career Award for Scientists and Engineers.

Kelley's nomination for the Jon Kelly Award was submitted by a group of her colleagues, who wrote that her leadership and vision have been instrumental in the success of the Cabled Array. They also noted that her dedication to mentoring and supporting early-career scientists has had a lasting impact on the field. The award will be presented to Kelley at the Ocean Sciences Meeting in New Orleans, Louisiana, in February 2026.

Update from NSF's R2R Project

Dr. Ed Saraceno-Cleary has been the lead science engineer for sea ice installations of buoys and hot-spotting drills for the Ice Observing System (ICEOBS) project, funded by NSF's Division of Polar Programs (OPP). Please see his full feature story in the [Fall 2025 UNOLS Newsletter](#), page 4.

Dr. Saraceno-Cleary is a Postdoctoral Scholar in the Department of Physical Oceanography at the Woods Hole Oceanographic Institution (WHOI). His research focuses on the dynamics of the Arctic Ocean, with a particular emphasis on the role of sea ice in regulating the exchange of heat, freshwater, and momentum between the ocean and atmosphere. He is also interested in the development of new observational technologies for studying the polar oceans, including the use of autonomous vehicles and remote sensing.

Dr. Saraceno-Cleary received his Ph.D. in Physical Oceanography from the University of California, San Diego, in 2021. His dissertation research investigated the mechanisms that control the formation and evolution of sea ice in the Arctic Ocean. He has also worked as a research assistant at the Scripps Institution of Oceanography and as a visiting scientist at the Alfred Wegener Institute in Germany.

Dr. Saraceno-Cleary is a member of the American Geophysical Union and the American Meteorological Society. He has received several awards for his research, including the Outstanding Graduate Student Research Award from the Scripps Institution of Oceanography and the Early Career Scientist Award from the Arctic Research Consortium of the United States.

2026 UNOLS-RVTEC Marine Technical Internship Program Update!

The UNOLS-RVTEC Marine Technical Internship Program is now accepting applications for the summer of 2026! Applications are due by April 30th. Please see the flyer below for more details, and visit the [Marine Technical Internship Program](#) page on the UNOLS website for the technical details of their May cohort, visit the [Marine Technical Internship Program](#) page on the UNOLS website.

Committee News

IMWCC Completes Report

The UNOLS Special Committee - the Arctic Marine Research Capabilities Committee (IMWCC) has successfully completed its report to the NSF Division of Polar Programs (OPP).

The IMWCC was created in 2024 and charged with the review of the current and future capabilities of the U.S. academic research requirements for marine research operations in the Arctic Ocean. The committee was co-chaired by Dr. Jeremy Kasten (WHOI) and Dr. Jennifer Eerkes (UNOLS). The report can be found [here](#).

During its work the IMWCC met in person twice, held three virtual meetings, and received input from the Arctic research community, which numerous times to facilitate the development of the report's findings and recommendations.

The report's main recommendation is that U.S. academic research continue to operate USCGC Healy, and that access be provided to the research community through the UNOLS fleet. The report also recommends that the U.S. academic research community develop a long-term plan for the technical details of their ship needs, visit the [Marine Technical Internship Program](#) page on the UNOLS website.

Fleet Highlights

With nowhere offline left on the map, what does it mean to be secure at sea?

Cybersecurity is a hot topic these days, and it's one that's also on ships. Ocean-going vessels rely on a complex network of computers, sensors, and communications technology. And, no matter how far you are from land, you're still connected to the rest of the world via satellite internet.

"Before, cybersecurity was all an afterthought, because we were disconnected from the world," said Chief Mate (CM) Ty Hall, [Ty Hall, Jr.] aboard. "We still are to a point. You have to go to Wi-Fi for Internet to the vessel. Now ... there's a lot more cybersecurity stuff that we have to deal with, and it's only going to get more and more and more."

While cybersecurity is not every fleet member's priority, what we've been up to lately would be of interest to anyone who's ever wondered what it takes to keep a ship online. Many systems that bring science capabilities to life rely on computers and networks, and the ship's operations, whether an individual system scientists rely on or the ship's overall navigation, rely on computers and networks, too. And the threatened system we're trying to protect is Ground Truth Navigation, which is the ship's navigation system.

"Ground truth, more and more, includes all sorts of things that aren't GPS," said Hall. "It's not just GPS. It's not just the satellite navigation. It's not just the radar. It's not just the sensors. We mesh [work] on, as we say, 'does it for sense?' Does it look right? Does it look like we're where we're supposed to be? And we're constantly looking at all of those different sensors to make sure that we're where we're supposed to be because it's not one machine; we feel our might experience a cyber attack, but we're still getting readings that are telling us we're somewhere else."

Now, who screams at cyber-vultures in sea dress?!?! Hall's answer to that question is a resounding "no one." Instead, he's been working with a team of people who are pretty smart, pretty grateful by the way that I'm one and to another person who's not on the ship, but who's been a huge help to us, Jeremy Kasten, who's the director of Woods Hole Oceanographic Institution.

That's how the Navigational Education for Advanced Cybersecurity Understanding and Research Experiences in Training (NEACURRENT) project was born. It's a project to test the secure transition of a training cruise focused specifically on cybersecurity. Hall and Kasten have been working on the project's underlying implementation for years. Kasten's team at WHOI has been developing the tools to make it possible, and Hall has been testing them on the ship. Now, the NEACURRENT project is ready to put it all together and see if it works.

"My goal, early on, is to sit at the helm with another person who's not a mariner and have them drive the ship and not be in control. I want to create a scenario where I can do that."

It was particularly important to get CT professionals who are not mariners to test the system, Hall said, because he and the rest of the crew have been working with it for so long that we've overlearned the challenges from offshore. That works in our favor when we're out at sea, but it's not a good way to test the system for newcomers and to effectively evaluate it. Hall's goal is to have the system ready for use by the Fall Academy Applies at sea, where it is difficult to commit to Ground Truth.

"Generally, no research ship, by its very nature, is set up to be a training ship, and that's a challenge," said Hall.

There are also an undertone of urgency to academic and policy conversations about cybersecurity, and the vulnerability of many of the IT-center law environments, and [Hall] is concerned that we're not ready for it. Hall's goal is to have the [Cybersecurity] system — all training on the system — ready to go by the end of 2026.

"I think it's coincidence," Lasker said. "[Today] we're out here, and we're talking about cybersecurity, and we're talking about the Internet. It just, that's one of the things that we've been working on for a long time, and it's finally coming together. It's not a coincidence that we're talking about it today. And it's taking cybersecurity like this to make sure that we're ready for it."

The ultimate hope is that bringing together IT and marine technology professionals will help to develop a system that NEACURRENT, in turn, will share with academic research vessels. Hall's goal is to have the system ready for use by the Fall Academy Applies at sea, where it is difficult to commit to Ground Truth. Ultimately, he wants to be able to say that we're confidently cyber threats along the way.

"It's open with the shoulders ... to be ready to have cyber-vultures in sea dress," Hall said. "I'm not saying that's going to happen, but I'm saying that's the goal."

A 4-D Seismic Experiment on the East Pacific Rise

R/V Marcus G. Langseth (MGL1907) Cruise Timeline Now Posted! Cruise ends 2/1/2027

Principal Investigators: Suzanne Carbotte and Maya Perpetuini (OSU-LDEO)

The Marcus G. Langseth will conduct a 4-D seismic experiment over the East Pacific Rise (EPR) in 2026 and 2027. The survey will be centered on the 9°N region. The experiment will image the subsurface structure of the EPR axial magma system and investigate how it changes over time. The survey will be conducted during 2 cruises (MGL1907 and MGL2001) in 2026 and 2027. The first cruise will occupy the survey area and collect baseline data. The second cruise will repeat the survey to look for changes in the magma system. The MGL1907 cruise was scheduled during cruise #03 (2026) and #04 (2027) of the Langseth's 2026-2027 circumnavigation.

The MGL1907 cruise was conducted aboard Columbia Clipperton to Hawaii to Tahiti. It departed from Manzanillo, Mexico on 2/1/2026 and returned to Papeete, Tahiti on 3/5/2026 (32 days at sea). The cruise was conducted by the Langseth's 36-channel seismic system and a 4-km long hydrophone streamer. The survey area was centered on the East Pacific Rise near 9°30'N, and occupied a 180° arc.

While at sea, we acquired 2,112 axial-orient line-kilometers of seismic reflection data. The cruise was funded by NSF for 2026 and the first of the 2026-27 seismic. The PI's are Suzanne Carbotte (Lamont-Doherty Earth Observatory) and Maya Perpetuini (Oregon State University). The cruise was conducted by a team of 35 scientists and technicians and 19 engineering & maintenance workers.

In addition to collecting the 4-D seismic data, we also collected a suite of geophysical and geological data sets which can be combined with pre-existing data sets to address the following scientific objectives:

MGL1907 Cruise Objectives

- Image the magma system at different stages of the 4-D seismic time-lapse experiment
- Test if and how magma lenses change over time
- Quantify the magma lens' thickness, width, and melt content
- Image the crustal accretion processes at the footwall of the EPR
